I wouldn't pay for it through "paypal" if it was only $1. Paypal doesn't protect there clients.

I hope you do just fine with this.

1556. PDW - Update

Newsgroup: rec.radio.scanner
Date: 2000-10-27 15:31:45 UTC
From: Jason Petty <pdwpaging@ic24.net>
Message-ID: <39F99FE1.BAF7F499@ic24.net>
Source record: 77005

PDW V1.03 - Freeware POCSAG/FLEX Decoder for Windows.

- Decodes POCSAG & FLEX paging signals using a
soundcard or demodulator interface.
- Real-time filtering.
- Signal indicator.
- Logs messages with time & date stamp.
- Many other features.

Main changes for this version:

1.Completely re-written the soundcard routines. Now decodes
through the soundcard (about) as good as the 2 level FSK
demodulator interface.
2.Added 3 different configurations to the interface setup
dialog box. These can help you to find the best settings
for your soundcard.
You can also set your own custom configuration.
3.Some small bug fixes to the filter options.

If you are new to PDW the most important thing to check is
that the "Invert Data" flag in the setup dialog box is the
correct way around for your scanner. If it isn't you won't
decode a thing.

You can get PDW from: http://www.pcapaging.ic24.net/

1557. Antenna jacks on Regency crystal scanner

Newsgroup: rec.radio.scanner

Source record: 77006

I have a question. I've got an old Regency crystal scanner (Model number ACT R10 H/L/U). It has two jacks on the back for external antennas (VHF and UHF). They appear to be Motorola jacks, but when I tried putting a motorola connector in them, the connectors seemed to be too big. Does anyone know of another connector similar in shape as the Motorola connector, but is slightly smaller?

The part that didn't fit was the tip. The rest seemed as though it would fit. If anyone has any ideas, please EMAIL ME DIRECTLY. Thanks.

It IS legal if the pilot allows it on private aircraft. You're not a pilot
mackey and know nothing of the subject.
Present the proof that it is illegal or be found a bald fool
by default.

David...

I have not run into the extremely slow squelch
action...but I don't spend a lot of time up in the
800mhz or 150mhz police, utility areas. The
clicking of the "Reed" type switches could be
misleading you into thinking the squelch is
a tad slow. I did note that I had to turn up
the squelch to 12:00 o'clock to get a fairly
tight squelch tail.

As to the Titan speakers...these are a fairly
small bookshelf type speaker...and, not as
the name might imply, a monster speaker!!

It was a casual thing that led me to try them
on the 8500...they merely accent the overall
smoothness of the receiver. As mentioned
before...static crashes as made less objectionable
by these speakers and a slight touch of the
IF shift..and even the bad static conditions
are livable.

You're right...the Paradigm 80's would be a
bit of an overkill on a Communications receiver.

Good Listening,

Leonard...

You need to get the model number off the radio to even begin to find out what the range may be. It is located under the battery. Second, you will need a license to operate the radios. You didn't ask, but the radios are computer programmable. You need the Motorola software, and programing cable.

I have a nice Kenwood TM-V7A in the box almost new with software and cable
for programing from a computer,also the optional cable for remote head.
This has box and all docs and all that comes in box.
I am asking $350.00 plus shipping.You won't be disapointed with this
radio.Any questions please email me.Thanks

1569. Re: BC 245 Lockup's

I get the same thing happening on my Australian spec 245 which has the latest version firmware as well. It also does it on VHF type 2 systems. I also own a US spec unit with the older version firmware and it does not behave like this. I have no major RF transmitters nearby, so I would say it is not an interference issue, just something unique to this firmware version.

What I have worked out is that when a site is inactive for a while, for some reason the 245 goes on a hunt for the control channel. Even if you lock out all the voice channels in the system, it still goes into conventional mode and looks for the control channel. On busy sites this problem isn't evident, but on quiet sites, or in the middle of the night it can be annoying.

One thing I have noticed is that it seems to only do this on trunk banks which have no talk group IDs memorised in the scan lists. Is this the case with yours??

Michael

As soon as I started to read the first message in the string I new there would be some *tight ass*
writing some clap-trap. I would be more concerned about the dodgy maintenance of some of the airlines, than some dude with a scanner....

It is the policy of US airlines to have their pilots DENY the use of
scanners on their airplanes. (It becomes an order of the Captain)
When the plane is underway, the Captain is the law & that is supported
by the FAA.

One that I like is the Premier RD-98 (BNC). It's a 17" coated springy
wire with (I suppose) a very small loading coil at the bottom. It's
sold as a dual band ham antenna and puts all my rubber ducks to shame.
There is an SMA version too, and it is also reviewed at the Strong
Signals website.

I worked in the AV/SCV Valley for a long time before moving down into Los Angeles. The helos you are seeing are going to mainly be the Los Angeles County FD Air Squads. HMNMH is a truama center and recieves trauma patients from both sides of the hill. Yellow and White helicopters are going to be LA County FD, Red and White are LA City Fire, Yellow and Blue will be Ventura County Sheriff, and White and Blue will be Mercy Air.

Most of the pre-hospital comminucations are now doen with cellular phones as opposed to the old Med-Net radio system. HMNMH was Med-3 the last I remember, unfortunately I don't have those numbers in front of me right now.

All helicopter traffic in Los Angeles will be heard on 123.025 or what is reffered to as "0-2" LACoFD and LAFD also have thier own am-band frequencies for thier air operations. Chances are you'll mainly hear them on the AV/SCV fireground channel Blue-12

Wait, I actually found mey book.

Med-3 468.050M/463.050B

I have 2 scanners hooked up to a Grove "Beam" antenna.

BC 760 xlt
BC 895 xlt

I use a splitter and cable, no amp, cannot tell any diff, using as single hook up or currently like it is, 2 scanners.

my 2 cents

1586. PA Emergency Situation Report list

Newsgroup: rec.radio.scanner
Date: 2000-10-28 02:41:31 UTC
From: PA-Sit-Rep <PA_Sit_Rep@yahoo.com>
Message-ID: <8tdecr$q59$1@nnrp1.deja.com>
Source record: 77034
Cross-posted to: rec.radio.scanner,alt.radio.scanne

PA-Sit-Rep is a Pennsylvania state-wide Emergency Situation e-mail list open to anyone willing and able to abide by the list posting protocol. List members are encouraged to invite other participants to join the list. List messages consist exclusively of those made by the voluntary list participants.

The purpose of PA-Sit-Rep is to keep all list subscribers up to date on emergency situations and activities of MAJOR import throughout the state of Pennsylvania. The list is a free communications tool that will enable subscribers to monitor situations throughout the State of Pennsylvania including weather emergencies, natural disasters, environmental disasters, police activities (major emergency events only), civil disturbances, political developments (ONLY OF THE MOST MAJOR IMPORT)and military activities such as urban exercises.

List members are encouraged (but not required) to send reports to the list pertaining to any of the above activities. Only reports pertaining to Pennsylvania situations are permitted. The PA-Sit-Rep list is extremely low volume because posts are limited to emergency situations of only major import and those which are relevant to Pennsylvania. PA-Sit-Rep is not a discussion list nor is it run from a commercial server (so you won't have to scroll through commercials in the messages).

PA-Sit-Rep may be of particular interest to individuals in the state of Pennsylvania who own wireless devices capable of text messaging. The list protocol is designed to accommodate these devices, which are usually either text capable pagers or Digital Cell Phones and are of limited message length capacity.

Any questions regarding list protocol should be directed to: pa_sit_rep@yahoo.com and the subject line of the e-mail should read: "PA-Sit-Rep"

Or, visit the PA-Sit-Rep web page: http://www.1stpa-militia.org/sit-rep.htm

You may subscribe to the list at the above address or by sending an e-mail to:

pa_sit_rep@yahoo.com

with the word "Subscribe" in the subject line and the e-mail address you would like to have subscribed in the message body.

List membership is subject to moderator approval.

Sent via Deja.com http://www.deja.com/

>It is the policy of US airlines to have their pilots DENY the use of
>scanners on their airplanes.

Eh, no. Most airlines simply don't put scanners on their list of approved devices for use in flight; they don't have to issue a "policy" too. As for Delta...

>When the plane is underway, the Captain is the law & that is supported
>by the FAA.

Well, to a point. The Captain cannot legally, for example, APPROVE a device that the airline has forbidden.

>Try getting the Captain to approve your scanner, even IF Delta says
>they allow it!!

1 - I don't have to ask the Captain, any more than I have to ask him about my laptop. That's why the rule is on the web site and printed in the inflight mag.

2 - Once I *did* ask a Delta captain about it, since I don't fly Delta often and I'd been surprised to see scanners explicitly mentioned as allowed in the inflight mag. He was on a "stretch break" in the f/c galley, as was I. He was surprised too (he used to fly for another, more restrictive airline), read the fine print, and then said !"if it says that in the book, I guess it's no problem".

He was pretty knowledgeable about radios and we had a good chuckle over the fact that a "VHF scanner" *is* an FM radio (and often an AM radio too), and that AM and FM radios were on the "banned" list... anyway, he didn't personally have a problem with it and it was DAMNED clear that the airline hadn't said anything to him about scanners before, one way or the other.

No kidding. A few years ago, I showed my wife that I could listen in on cordless phone conversations, using just an everyday plain old handheld scanner, and she just about flipped! I then explained to her how dangerous it is to provide credit card numbers and other such confidential information on a cordless phone....

Ignore this guy's drivel.

Point 1:

If you are flying delta then it's certainly ok. Says so!

Point 2

That doesn't mean that you should show it off. Be discrete because most crew members will not be confortable with the use of a scanner on board (for various reasons - it depends on the person). If they ask you to turn it off you must do so no matter what airline policy is. They have final say.

Point 3

Don't specifically ask for permision to use a scanner. You will most likely be told that you cannot use it.
If you do ask and are told no don't wave the printout from the webpage - remember the crew has final say.

In China it is illegal to own a scanner.
In Chine all cellular systems are analog, making it easy for the government to monitor.

Al Gore supports advanced cellular and Internet monitoring for as he says "national security." We already see what the Justice Department allows the FBI to do. The current Justice Department now wants to expand the ECPA, and outlaw more monitoring and restricting scanners and ham radios. Have you had enough of the government taking over your private life? This is crap.

I try to keep politics to myself. Like the old saying about religion and politics....However, I find myself angered by the government restrictions and intrusions. To only solution at this time is to vote 100% Republican. For some, this means voting for the lesser of two evils. Don't waste a vote. Vote Bush or find the government taking away guns, more public land, scanners, ham radios and much much more. SAY NO!!!!!! Vote a Rupublican ticket this time.......

HUH?

Here in NC, there are HUNDREDS--maybe thousands--of older John Deere models running. There are clubs dedicated to old tractors. We recently had "Cotton Ginnin' Days", an annual event where all kinds of old equipment was running. John Deere tractors went back to 1925 complete with metal tires/wheels. Even an old 1927 steam threshing machine in steam. Old cars, old "one lunger" engines, etc. There was homemade ice cream--churned by a small hit-n-miss John Deere engine. All my lawn and garden equipment is JD, of course, influenced by my younger days driving a JD Model G (Pop! Pop!)

No John, you are completely incorrect again.

There is no difference in the FAR between commercial
and private aircraft. It is up to the aircraft operator.

If you don't own it, you can't control it.

What did you "pay" for it with?

Read the printing in the upper left corner of the post-1964 paper the Supreme Court defined as an IOU in Knox v. Lee in the 30s.

THIS NOTE IS LEGAL TENDER FOR ALL DEBTS PUBLIC AND PRIVATE

Now find a pre-1964 paper and you will find that it further noted:

AND IS REDEEMABLE IN LAWFUL MONEY BY THE BEARER ON DEMAND

That which "pays" for goods and services is lawful money, that which is a legal tender [offering] for debt only "buys" indebtedness.

Fortunately this can only occur in a democracy. Aren't you glad your government renounced such an antiquated, obsolete republic of government for your modern, with-it, democracy?

That's great and I envy you. Where I live in Central
California, we just can't afford to use such old equipment
in actual ag operations. If I looked long and hard, I might
be able to find a 2-cylindar still working, but I doubt it.
My 1976 model 4430 is getting very marginal. But I drive it
myself, so I don't have to worry about the labor costs like
my neighbors do. The repair bills, on the other hand, are
killing me!

There are good websites about antique steam tractors and other farm implements. Every once in a while, the Discovery channel will run a program about clubs that collect and display antique farm implements. If you haven't been , sometime go to the Smithsonian Museums in Washington. They probably have the best display of different tractors, including a lot of steam tractors and other related items. They had one around, 1910 that was bigger than a railroad locomotive, developed 10 or 15 horsepower and only went something like 4 m.p.h. Originally the steam tractors only had steel wheels, got stuck in mud easily, and they eventually started using tracks like tanks and other military vehicles. The steam tractors originally gave the U.S. Army the idea to use tracks instead of wheels. The steam tractors provided the locomotion power to run a lot of things on the farms. There was a pulley, somewhere off the engine. They would hook a motion belt to power generators, corn shuckers, pumps and everything else you can think of. I like steam engines and you can find all types of websites about antique and modern steam designs. Most people don't realize this, but the old steam powered railroad locomotives didn't have an actual top-end speed. They would run until they blew up. You could easily go 100 M.P.H. and faster depending on the size of the engine. I read, two or three different places where they clocked a Stanley Steamer automobile going 197 m.p.h at Daytona Beach in 1909 or 1910. Whether this is true or not, I don't know.

Obviously American History isn't your high point. It has NEVER been entirely a Democracy. It has always been a Republic.

Are you ready for an election result where the elected, (By the Electoral College), is NOT the one that receives the largest Popular vote? Look back in history about a hundred ago. It just may happen again.

And to think the "clipper" chip has come to pass. How about the requirement to store the encryption keys with the Government? More Democ-RATS. Yea Clinton - Gore. I want no more!!

B-Squared

Are certain connections superior to others(i.e. 259 versus N, ect)?

I think I was reading a review on Strong Signals were Rich was stating that certain connectors were better as an RF connection. Yet I could not locate an article(out of the many!) in regards to this subject. Is there an article at Strong Signals talking about this?

Any thoughts?

Thanks, Glenn

Take a trip to your local library and do a search of old newspaper articles on scanner, and cell phone monitoring, laws. I think you might be surprised to discover that many such laws were enacted while Bush was president, and many of those laws were passed in states dominated by republicans (republican governor, or republican house, or etc).

N Connectors are better than PL 259 for several reasons.

1) Lower loss. Any time you make a connection you will have signal
loss. When using an N Connector less of your signal will be lossed.

2) N Connectors are water proof - PL 259s are not.

What is interesting is that Protection Detail SS units do not use the radio network/system already installed in whatever city they may be operating. The advance team sets up their own mini network, placing transmitters strategically along the points to be visited. (airport, hotel, points in between). Because of this they use relatively low power transmitters, which cuts down on the range in which they can be monitored. It seems like quite an elaborate system to errect each and every time a visit is made, but hey its our tax money not theirs. The radios are set up and maintained bu US Army signal corps staff.

Happy monitoring

1629. Re: coax connections question

Newsgroup: rec.radio.scanner
Date: 2000-10-28 23:31:00 UTC
From: Jim <jspaz@i-55.com>
Message-ID: <39FB61B3.E86C81B1@i-55.com>
Source record: 76877

There are a number of RF connectors on the market. It all comes down to just how much you want to pay. The PL-259 is about the most common connector on the market. Most people will say that the type N is better. Yes it is sort of water proof. It is a much better impedance match. Yes it is some what lower loss for insertion.

If you are not using the cable for transmitting, it probably won't matter. All these losses start adding up as you go higher in frequency. Only point is, that the cable will make more difference than the connectors. At 850 Mhz. you need to pay close attention to the cable loss.

If you want the real low insertion loss connector, then go for the 7/16 DIN connector. This has lower loss than the type N. Only problem is that it cost much more than the type N.

The average person does not need to go to the expense of using the 7/16 DIN connector for a receiving antenna system for a scanner. Just use a better cable. The difference between 1/2 inch heliax style cable to 7/8 inch will make a difference at the 850 Mhz. point. If your cable runs are short, don't worry about it. You can use something like Belden 8913. Just get the connectors that fit it. The center conductor is larger than normal RG-8 type coax.

Jim

1631. Please help with BC 855xlt

Newsgroup: rec.radio.scanner
Date: 2000-10-28 23:54:54 UTC
From: Loren <loreng@southwind.net>
Message-ID: <7CJK5.772$RP6.149568@nntp3.onemain.com>
Source record: 76879

I have a BC855xlt, ID code 0AID. I'm wanting to apply the 100 channel mod
but it doesn't have the jumpers that are always referenced in this mod. The
ID indicates it was made Jan 1994, right on the cell mod cutoff, my question
is when they took away the ability to modify it for cell did they take away
the 100 channel mod ability? Any help would be really appreciated.
Thanks

Takes me longer than that to get out of the house, get the truck
started and get on the road. :)

Actually, the paper was well written and addressed all of the issues
Dwight raised plus a few more. The abstract only touches on a few
points.

There was a bit of discussion some time ago about the difference of
effect between duplex (cell phone, passenger discussions) and simplex
(two-way radio operation) communications while driving. Most were of
the opinion that duplex took a lot more concentration regardless of
equipment used.

I am looking for help getting some frequencies for central Iowa. All the websites I used to visit are now apparently defunct. Our Police just recently went to an Ericsson trunk system. I bought a cd from Radio Shack (Police Call Frequency Guide) that was supposed to have the new frequencies but as usual they flopped as it was out of date. Also, I am afraid I have a lot to learn about trunk. Thanks

For all you mackey lovers and haters, the appropriate forum is "alt.fan.john.mackey"

Since the forum has been un-used, I assume he does not have any fans, But it still will reduce "off topic" bullshit in the scanner groups.

When replying to any "MACKEY" post, change the group FROM scanners TO"alt.fan.john.mackey".

The 99.9% of us that come here for scanner information would appreciate it.

Thanks from the people that actually know what a scanner is for.

Hi,
I was wondering if anyone knows the band plan for the UK Police UHF Channels as I understand the Band plan on UHF is as follows:

Channel 7 UHF PR to Channel 89, What I am looking for is a channel plan which gives the frequency and official channel numbers e.g. ch 7 is 451.3250 - 451.3250 example.
And so on, also if anyone has access to the VHF Channel plans and who uses what I would be really obliged.

Here in Little Rock, Red Lobster, Olive Garden and Chillis have gone to a individual paging service for customers waiting for a table instead of the yelling over the loudspeaker "Smith Party of 4 Your Table is Ready".

Is anyone familier with these small square (4" x 4") gizmos which lights and vibrates when ur table is ready? The only thing I could find on the Jtech webpage is that they may operate in the 27 mhz range and don't have to be licensed.

Was curious if there was anything to monitor or just the usual pager tones.

Thanks in advance.

Nashville's system is primarily running off of CDPD, with a double DES encrypted system by SCA software.

Brentwood uses a private system, again using encrypted software.

Anyone who reads this group should know that there is more behind anything!

That broken Coke machine at work? It's not a mere mechanical problem, it's a conspiracy by management to get you back to work!

Those numbers on the back of a road sign? They aren't there to help highway workers know when the sign was placed and by whom, oh no, they are a special code to help UN Troops orient themselves when they are air dropped in using jets marked just like commercial airliners.

Weary of conspiracies....

From: CapeGuy <mdelorme@my-deja.com>
Message-ID: <8thrdt$t4l$1@nnrp1.deja.com>
Source record: 76911

Does anyone know if Blackberry handheld wireless e-mail devices can be used on board commerical aircraft?

To note: It is possible to turn off the Wireless Networking capability of this device, which would at least allow you to catch up on e-mail while flying, and transmit them once you are safely back in the terminal building.
However, I know airlines have a strict list of allowable electronic devices that can be used while taxiing or in flight.

Thanks to anyone for more information.

Hello all, I am new to the wonderful world of radio scanners. I live in Canada and am looking for advice and what to buy and where to buy it.

First of all, I don't know much about what the capabilities of various scanners can be. Can any scanner out there pick up cell phone frequencies? What frequencies are recommended?
Are there any good honest web sites that sell scanners at a good price?
What are the recommended brand names and models?
Any information would be helpful, I am very intrested in the possibilities of monitoring cell phone frequencies if possible.

Only thing I can add is that if you inspect one closely, you can see a set of pads identified with binary (2,4,8,...) numbers, presumably for assigning the particular unit its' ID. Given that, I suspect there isn't anything to monitor but a digital noise burst. They would, however, (as another person suggested) be rather easy to set off all at once.

Cape Guy:

The "Blackberry" won't work airborne, anyway. I never turn mine off - but about 5 minutes after takeoff, I'm already out of range of the towers, and it goes dead.

You probably could go ahead and respond to messages while you have a "no-signal" and then "open" them and "resend message" those messages once you're back in range.

Despite what some folks say, the answer is YES. Delta specifically allows it after the aircraft has ascended past 10,000 feet and allows it until it descends 10,000. This is the point where it is announced that "the use of permissible electronics is now allowed/disallowed"

If you look at the delta in flight magazine, in the back is the list of permissible electronics. VHF scanners is specifically listed. I scan all the time on dellta flights and have talked to the pilots about it (many of whom were surprised it was allowed).

Still, I take a low profile, but tore a copy of the rules out of the magazine and keep them with the scanner. BUT THE DELTA AIRLINES RULES AND REGS SPECIFICALLY MENTION THAT VHF SCANNERS ARE ALLOWED TO BE USED WHEN THE AIRCRAFT IS ABOVE 10,000 feet.

there are other airlines that also allow it, as one person mentioned, it is up to the command authority (which is usually the airline carrier).

cheers

1698. FS/FT: Radio Shack Pro 2042 Base Scanner

Newsgroup: rec.radio.scanner
Date: 2000-10-30 14:21:25 UTC
From: Dan Schopp <dschopp@sprintmail.com>
Message-ID: <39FD83E1.CFBB762B@sprintmail.com>
Source record: 76948
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

For Sale: Radio Shack Pro 2042, 1000 channel base scanner. Some of the features:
10 banks of 100 channels
100 monitor memories
10 link able search limits
Auto store, auto sort
Direct search
Wide coverage- 25- 1300 mHz less cellular and part of the UHF tv band.
Selectable mode - AM, NFM, Wide FM
Selectable step sizes - 5, 12.5, and 50 kHz

With this scanner you can listen to everything from CB to tv audio, to FM broadcast stations. The Pro 2042 was Radio Shack's top of the line scanner. It is the successor to the Pro 2006. Radio is in perfect shape, comes with a copy of the manual and telescoping antenna.

$250 or what do you have to trade ? Interested in trading for a Yupiteru 7100 or same price portable SW radio.

Thanks

Greetings,

California has very liberal scanner laws. You can have them in your car or a handheld on your person. The major law that specific applies to scanners is; if you break the law: rob a bank or 7-11 and have a scanner with you, they throw the book at you.

Since the move is on very rapidly to digital technology in cellphones, there is not much to be gained by monitoring cellphone frequencies anymore. So my advice is simply to forget about that function. You didn't mention if you wanted to buy a 'base station' or a 'handheld' scanner.. Handhelds are very popular since they can be used either mobile or in the home. The Uniden BC245 is probably the most popular and can do what is known as 'multi-trunking', where you can monitor both conventional frequencies and trunked systems at the same time. The Radio shack 92A is also very popular and is also capable of 'multi-trunking'. Radioshack also has a mobile version of the handheld 92 known as the PRO 2067, which requires a 12v DC power supply. Both have 500 channels. The Uniden 245 has 300 channels.

So take a good look around this newsgroup and try to absorb as much as you can and you'll learn a lot and be better able to make an informed decision about what to buy. Another good place to look around is the Strongsignals website, which is run by Rich Wells, a very respected and knowledgable person on the subject.

1709. Probe v4.0 and Recall software question

Newsgroup: rec.radio.scanner
Date: 2000-10-30 17:04:25 UTC
From: junkmail <junkmail@junkmail.com>
Message-ID: <gmarvscg1p71c7cbnf6mutqoeee1vltajt@4ax.com>
Source record: 76957

I'm using Probe version 4.0, and I'm trying out the RecAll software to log what my PRO-2006 hears. At one time, I was able to get Recall to annotate the audio files with the frequency, so when playing them back, I could tell just what frequencies were active when.

Since my latest computer crash, I can't seem to get this to work. I remember there was something you had to do in a particular sequence to get it all to work, but I've tried all the combinations I can think of, and it still doesn't work.

The audio is recorded just fine, but it isn't annotated.

Any assistance would be appreciated.

Yah. The logical conclusion of these "don't phone and drive" laws is that
we'll also be prohibited from talking to our passengers while we're
driving.

>>
>Still waiting for you to provide something usefull. This means nothing. As I
>said - site the specific federal law that says this.

("useful", "cite") Well, it IS true that the Pilot In Command has fairly broad authority. The PIC *could* say "I don't want scanners being used on this flight" and even though the airline policy allowed them, pax on that flight would be required to comply. If challenged, the PIC might be required to come up with a safety-related justification. There ARE reasonable justifications for that, by the way. A lot of routine ATC comms (like "no, tower, we do not yet have the airport in sight") might be pretty alarming to pax who don't know the routine. This is one reason some UA captains prefer to turn off the Channel 9 feed.

But that bit about "it is the policy of US airlines to have their pilots disallow scanners" is pure nonsense, obviously made up out of whole cloth.

In a way I'm grateful -- my posts here have never before been a subject of one of Mackey's made-up-facts. (Maybe we should call them Mactoids?) Now at last I feel like I... Belong! *sniff*

1726. Joplin, MO Scanning Info.?

Newsgroup: rec.radio.scanner
Date: 2000-10-30 23:36:30 UTC
From: Doug Fisher <psleprob@hotmail.com>
Message-ID: <39FE048E.5813DA2B@hotmail.com>
Source record: 76974
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Can anybody please, help me out with information on the trunking IDs for the Joplin, MO public Safety trunking system?

I have found the found the freqs for the system and a few ID's listed on some web sites, but the IDs are pretty incomplete.

Found on websites:
1648 Patrol Disp
1656 Patrol that is usually encrypted
1776 Records check
4848 - Fire and EMS Dispatch

Other IDs that I have found in "search" mode along with my guess as to what they are:

1616 PD talkaround 1?
1656 talkaround 2?
1712 PD channel 4?
1808 PD "side" channel
4880 another PD talkaround channel

4976 METS talkaround? St. John's hosp. comms?
5008 ambul. to ambul. chatter?
5360 another dispatch channel for METS?
5424 amb. to hosp.?
5456 METS talkaround?
6736 Freeman to ambul.?
6896 Hospital shuttle vans/courtesy vans/non emerg. transport?

Does anybody know how the air ambulance service's helicopter communicates?

If you have any IDs to add or any interesting frequencies for the Joplin area (I have the ones from Police Call), please post them here, or if you are afraid of spam, to the auto replay address for this e-mail.

Thanks in advance,
Doug

Source record: 76989

It depends on to what you want to listen. If your primary interest is 800mHz trunking, try using an old cell phone antenna. For regular VHF/UHF listening, try an old dual-band amateur antenna. For low-band listening, try a used CB radio antenna. Or you can get one for each and run them through a couple of T-connectors. You can find all of these pretty cheap at your local flea market, on E-Bay, or here in the newsgroups. Or you can get one of those El-Cheapo discones that some guy sells on E-Bay for about $25 + $6 for a mast + $10 for the mast mounting hardware.

Not any "made-up-fact", simple trueness. Even Eric Oyen supports me
with his statement recently made on this same topic where he said:
"The FAR's forbid the use of any electronic equipment
not specifically designed for use on aircraft".

Proof positive - 'Nuff said.

Hi all.

I know this request is a little off topic area, but I would greatly appreciated any information as to where I might find accurate lists of HF frequencies for the Royal Navy and Royal Air Force.

I have been unsuccessful searching the net, so maybe someone could point me in the right direction.

Many thanks
Troy

Cannot remember which particular edition but there have been several articles in R&C covering this topic. Each edition there are also a fair few of the freq's covered in the Military/Utility DXing article. The author of this article does have his own web site which you might like to check out - last time I looked it was at - http://members.nbci.com/caradoc/
WRT the RAN you will find that there is not that much activity on HF that is not routine admin - anything that is really interesting (excepting SAR activity) will be encrypted or conducted on UHF - and also likely to be encrypted.
Given that UHF is line of sight, unless you live very near the coast you will not hear much if anything at all - there is of course sattelite activity but I doubt that you will hear much from Aust on these - mainly inhabited by yanks.

Cheers

Matt

Do You mean the Royal AUSTRALIAN Air Force and Royal AUSTRALIAN Navy
Or are you after the Royal Air Force and Royal Navy(British)???

your au address suggests you want the Australian freqs?

For Sale: A Radio Shack Pro-71 handheld scanner. Not even a year old. It looks as if it has been replaced in the year 2001 catalog by the Pro-79. 100 channels. MINT condition. Comes with orig. box, manual, AA Nicads, Mobile DC adapter and duckie antenna. First $69 takes it. (Plus $6 towards shipping and insurance.) If you're short on cash, we can make arrangements for a credit card purchase through my ham/swl business. (Plus you'll get it quicker, too!) You can email me at ars--kc8bcr@webtv.net or phone me at: 1-517-563-2613

YOU'RE pissed off!?!!? You're the moron that not only sends inappropriate for sale SPAM to a shitload of NGs, you have the nerve to send it in HTML with crappy images embedded!

Plus, your HAM equipment for sale SPAM has little place in comp.sys.laptops. And the majority of NGs are for _discussion_, NOT for posting for sale ads.

As to reading or not reading an ad, you miss the point. Some people still pay per minute or per byte downloaded from the internet, as hard as this may be for you to believe. Why should MILLIONS of people around the world be forced to pay to download your trash?

There are appropriate forums for posting for sale ads, and appropriate formats for doing so. People subscribe to these forums knowing before hand what they'll receive. When people subscribe to discussion newsgroups, they expect discussion, not HTML laden SPAM.

Rather than sharing your childish tantrum with us for the rasher of well deserved shit you received in response to your selfish act, spend a little time educating yourself as to the form and function of the newsgroups.

After reading your most recent post, you're even MORE of a DICK than I had originally thought, if that's possible!

GTFU!

Fine! BUT due us all a favor. if it is on Ebay or another auction
house please put FA = For Auction.. FS = For Sale..

Their are those of us that do know where ebay is and how to
use the search engins to find what we are looking for..

I do not need to download something that has a subject line
that interests me only to find a link to ebay. IT'S a WASTE.

That is the other side of the coin.

I have been diligently trying to find a website that has a lot of pictures and detailed history of Bearcat Crystal Scanners and others. If anyone has a link to a good site that covers that, please post it here.

Thanks,
BTJustice

1768. Introduction to speech inversion descrambling!

Newsgroup: rec.radio.scanner
Date: 2000-10-31 17:02:41 UTC
From: ctpds49@aol.com
Message-ID: <20001031120241.14834.00000747@ng-fm1.aol.com>
Source record: 76817

Speech/Frequency Inversion is accomplished by mixing the speech spectrum (typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz constituting the speech inversion.

What a bright and shining beacon of ignorance you are. It's almost refreshing if it weren't so sad. Have you never heard the term "think globally"? It applies to the internet.

Many people in countries throughout the world have one means of accessing the internet, the local government operated phone system. For which they often pay on the basis of per minute of connect time. It has nothing to do with "rich bastards on cell phones". I'm very happy that you have unlimited internet access, but not everyone is as fortunate as you.

Apparently, you have never bothered to read the Acceptable Use Policy of your ISP at: http://www.qsl.net/aup.html so why don't you use some of your unlimited access to educate yourself right now.

The simple fact that you can take umbrage over the fact that the answer to your assumption "Is the News groups for selling items or what???" was NO, is ample evidence of who has best earned the title of moron.

3's!

PLONK!

How ironic that your name is "Dick".

1771. Freq. assignments in trunking system

Newsgroup: rec.radio.scanner
Date: 2000-10-31 17:53:50 UTC
From: billc <billc@entermail.net>
Message-ID: <01c04363$86364220$6db60587@nj0117wclegg.wh.lucent.com>
Source record: 76819

I have a question about frequency assignments/usage of repeaters used in a non-digital trunking system i.e. where the traffic is FM. I guess this is called Motorola Type I or Type II or similar.

I understand the basic concept whereby the mobiles or portables listen to a control
channel and are assigned a frequency to talk on when they transmit and all of the radios in the same talk group move to that frequency but I do not understand how frequencies are assigned when the mobile has to transmit through a repeater. In a conventional repeater, two frequencies are actually used; one for the input and a second for the output but I have never seen anything about how this is done on a trunking system.

I have seen lists of trunking frequencies, for instance, my state police but there
is no mention if there is a second corresponding list that is used for input
frequencies. Do they use the given list and assign the input and output frequency
when it is needed? If so, this could have a significant impact on the traffic capacity
of the system and it would also mean that I should be able, if the mobile were close
enough, to hear the same transmission on two frequencies. It would also mean that the mobiles in the talkgroup would have to be commanded with a frequency and offset. A base station working through a repeater could use a phone line for the
input but that obviously won't work for a mobile to mobile.

I guess I am missing something here. Any insight would be appreciated.

Thanks,
Bill

1772. Re: ORIGINAL OWNERS MANUAL FOR ICOM IC-R100

Most of the RN comms is digital and/or satellite except when talking to
"civvies". You can get some SSB activity during NATO excercises etc.
The dates for these are often published in various mags.

So blow it out of your shorts!

I and other have asked NICELY to place FA in the subject line if it is for auction. That way those that do NOT want to deal with it can filter it out. Then some purported "intellectual" does a FS FA that hoses up the filtering.

For YOU that insist that everyone drop dead for YOU - Stuff it!

I don't hide behind anything. Some courtesy was asked for, and it IS obvious that it isn't to be had from THOSE of YOU whom THINK that this is ONLY for their personal SALES.

IT IS NOT!

You want to be pissed off? GREAT! I hope this pisses you off even more. Go READ the FAQs - Or are you also illiterate?

Trunks use the standard offsets, like normal systems. If it's 800 MHz, 45
MHz. The controller just tells the group to use a given channel pair.

If you don't have a trunking radio, and want to listen to your local
law/fire, at least when they're close to you, you can program in all the
input channels, and just treat the system as 'random frequency simplex',
though you won't hear the base side, probably.

Or what. This newsgroup is for talking about laptops. Others are for talking about other subjects, such as ham radio (alt.ham-radio.mods) and amateur radio (rec.radio.amateur.*).

Most are not for selling anything. Who told you they were? (It's clear you are both new to usenet, and not possessed of any great degree of social skills.)

Okay, that make sense. I currently do not have a trunking scanner but I do what you
suggest and just program the entire freq. list. I assume now that the published freq lists are the repeater transmits and if it is like cellular, then the input
is 45 MHz below. I guess I can also assume that each repeater site can transmit
all of the frequencies simultaneously, similar to cellular.

i think most people would appreciate a FS is its available for immediate sale
and FA if its on auction listing, clearly very different as posting FS already
makes it slightly deceiving

Yes they have an input like all other repeater systems (45 MHz below).
People don't reference the input freqs much, because they don't help in
tracking a system. It is worthwhile, however, to check the inputs, since
many trunked systems have what is called "talk around" that is basically
simplex communication on either the input of one of the trunked frequencies
or the output (usually used only when out of range of the system).

David,

I think he is trying to avoid spending $80 to re-crystal his radio, hence
his word "CHEAP". :-)

Good suggestion otherwise.

Somebody tried to start a rumor that you couldn't get rocks at the Shack so
it doesn't hurt to remind folks of the actual facts.

The newsgroups which have "SALE" in their name are for selling things. If a newsgroup hierarchy includes a selling newsgroup, that's where you're supposed to post your message; anywhere else is merely spam.

1787. Re: "New" Pro 92B vs. BC245XLT?

Newsgroup: rec.radio.scanner
Date: 2000-10-31 21:55:03 UTC
From: chuck@nospam.latraffic.org
Message-ID: <39ff3ef5.66481824@news.uia.net>
Source record: 76836

Got a 92B yesterday. It still misses MOT type II traffic that the 245
doesn't miss. I'm just trying to figure out how I can really tell if
it's locked on the control channel or not. I'm assuming if it loses
the control channel it will just revert back to "the old way". :-(

Bottom line is, it's still better than the original 92 but there's
more room for improvement.

Pretty close, I was told today 3-6 weeks.
I am going with JAN and pay the dam "$2" to expedite the order
I like my NOS Bearcat III boatanchor "Great audio with the new speaker" and
all the LEDs.
I do not like these modern plastic radios with small speakers
I dont mind paying for crystals I just use the local cops, fire, and
traffic helicopter frequencys

Hello kb,

The answer is yes. The batteries in the pack generate 4.8 volts,
but the power connection is 12 V DC. I got a suitable wire at
Radio Shack for direct connection to the cig lighter. Make sure
you get the right size connector, and the correct polarity, as
marked on the radio.

Cheers,
Peter

Alan,

I have 2 solutions that are both cheap, easy and work very well.

1) Get yourself a $10 Radio shack telescoping antenna. they have two models, one with a right angle base (to connect to a base unit) and the other with a BNC connector to connect to a hand held. Both work very well on VHF LO, VHF Hi and UHF and reasonably well on 800 MHz.

2) I prefer this solution. get a Hustler Mag mount scanner antenna. I have 2 of them because they work very well and I got my last one from Lentini (its not on their web page). Costs about $25 or so. You will need to stick it on the largest piece of metal - a filing cabinet is good. I have one that is stuck on the metal covering a hot water radiator. This antenna performs very well on all bands.

The input jack takes 12vdc (center positive), which is stepped down
internally to 4.8vdc to charge the battery and run the radio. While it will
probably run from a cigarette lighter plug, your alternator puts out 13.8v.
The BC235 may not be able to handle the over-voltage.

The Radio Shack mag mount scanner antenna is also pretty good on a file cabinet. There is a HUGE improvement over a conventional handheld antenna when a mag mount is stuck to a large piece of metal, such as a file cabinet, metal bookcase, steel shelf unit, or metal cubicle shelf.

The $10 Radio Shack telescoping model has got to be one of the best values around. GREAT for a $10 antenna! <G>+++++------------

still
> for sale!

To you maybe the item is for sale as your are after all selling it, *but*
for the buyer it makes a big difference.
In the FS case they can look at the item, find the price (or make an offer)
and then either buy or not.
In the FA, they have to go to a different site and bid. Bidding may take
many days and they'll not know if they have the item until the last couple
of seconds.

>Is the News groups for selling items or what???

Actually...No.
At least not the group in which I'm reading this "rec.radio.amateur".

There are groups such as where the FS and FA are appropriate such as
rec.radio.amateur.swap and rec.ham-radio.swap, but none of the groups I see
listed in the groups to which this was posted.

The FS and FA by convention let those who are not interested filter those
posts out and they serve as a guide for those interested in them.

> You guys or what;;;Don't jump on your high horses to tell us we can't do
> this or that.I think I talk for a lot of people on these News groups that

That's why I use filters.
You made reference as to whether specific newsgroups were for selling and
there are specific groups where FS and FA are welcome. On the other
discussion groups they are not usually greated with a great deal of
entheusiasm.

Me.? I could care less what your post, where.

>Also
> grow up and join the wannabee police academy......My two cents

worth........
>

And...I'm using the same e-mail address I've used for years.
My personal home page even has my phone number, but it only gets an
answering machine.
Being a consultant, my address is there as well although the page is not a
business page..

These chargers will charge COBRA FRS units come with AC and DC charger and have a slot to charge up spare battery as well. I have two and they are new in box, never used. They sell for $29.99 each but I just want to get rid of them as I have no use for them so any "reasonable" offer will be entertained.

I figured I would try here first if not I will put up on eBay.

Thanks,
Jorge

I have had mine for several years and am reasonably satisfied with it.
However, I only listen to railroad frequencies (160 & 450 Mhz). I like
that it uses AA batteries. I stopped buying Uniden because of the
expense of their rechargeable batteries which always needed replacing
after awhile.

Cheep and works is the Radio Shack mag mount with the two black plastic
center loads. 20-012 $29.99 works from cordless to 800 trunk very well.

Best choice!!!>>> Austin MDL: Spectra $ 79.00 + mount, this one is used
by the government should know). Get the mag. mount and you can use it
any ware car, home, and hotel.
Spectra Multiband Mobile

4-band performance for commercial or scanner use

Austin Antenna's Spectra is a unique, patented, multiband design
that brings you unparalleled 4 band, tuned antenna performance!
The Spectra covers Low Band (30-50 MHz), High-Band
(150-170MHz), UHF (450-470MHz), and 800-1000MHz and is
transmit capable within these bands. Power handling is 100W.

When used mobile, UHF and 800-900 MHz bands are covered by
high performance 1/2 wave elements. Low and High bands are
covered by Austin's exclusive, offset fed, 1/4 wave elements
(which
provides a lower angle of radiation and better performance than a
standard 1/4 wave ground plane). Translated, you'll hear the
difference because this antenna performs!

Spectra's compact 33 inch design adapts easily to all vehicles
with
it's low profile Motorola type, screw-on, NMO mount. The design is

patented #4,940,989 and is in use by numerous commercial mobile
users and avid scanner listeners alike.

Radio Shack doesn't sell them. They can order them thru a supplier (Radio Shack Unlimited maybe) and they can be sent to your local Radio Shack or to your home within 3-4 weeks after paying $5 per crystal and $2.50 shipping per crystal for a total of $7.50 per crystal. $75 for 10 crystals is a little too rich for my blood. I was looking for used crystals that had been tested to work.

I appreciate all the replies so far (I think). We can all do without this argument that is starting to brew. I was just wanting information. Not a flat out series of hate posts. I am sure others may be looking for crystals cheap and may refer to this post hopefully.

So what if he supports you? He's wrong.

So now you've switched from your theory about a secret policy that no
pilot I've ever talked to will admit exists, and which isn't necessary
anyway because all the airline has to do is NOT list scanners on its
approved list of devices -- to claiming that the FAR backs you up.

Problem is, the FAR *doesn't* back you up. I posted it; clearly you
either haven't read it, haven't understood it, or -- in a futile attempt
to stonewall -- you are simply stubbornly refusing to acknowledge that it
says what it does.

The FAR in fact says nothing about "designed for use on aircraft" (which
you'd know if you'd read it -- that's something else you made up).
Instead, it gives a list of a few devices that are specifically allowed
to be used, but then goes on to add that:

(5) Any other portable electronic device that the part 119
certificate holder has determined will not cause interference with the
navigation or communication system of the aircraft on which it is to be
used.

... may be used. That's how airlines can permit the use of llaptop
computers (since they're not on the list in the FAR), and that's how Delta
is able to allow scanners.

In case you missed my previous post, you can read the whole FAR here:

Well, after this nonsense went around last time, I went into my local Radio Shack, looked up the freqs for some crystals I needed for my Regency and crossed them to the RSU p/n. The clerk put them in the POS (Point Of Sale) computer, found they were available and charged me $2.50 s/h total for 4 crystals (not $2.50 apiece). I received them in the mail 5 days later. The return address on the package is:

Radio Shack Unlimited
401 N E 38TH STREET
FORT WORTH, TX 76016

If Radio Shack Unlimited isn't selling these crystals anymore, then somebody needs to tell them that an unknown group has hacked into their POS system and is using their name to sell scanner crystals. Quick, TW, call Mulder! It's probably the Air Force using their captured flying saucers to replicate the crystals and deliver them to my house!

Mark K5MAR

PS: It amazes me how often some of these people, like TW and J. Mackey, have to change their screen names. Probably so they can get past everyone's "block sender" list with their nonsense.

You wouldn't want to rephrase that so it makes sense would you?
The tone you selected (3500hz) is already an audio frequency
along with the speech spectrum you were mixing it with.
The resulting mix is normally referred to as "products"
or Heterodyne frequencies.

True. Part of the blame for this, however, rests with the manufacturers of
these radios who often tout them as having "38 private codes", etc. I can't
count the number of times I've heard people thinking they're on their own
"private channel", simply because they're using the CTCSS tones.

anyone have pd frequencies and fd for san benito county california
I now have most from Santa Clara county...

I work in mountain view but travel from Gilroy and Hollister...
traffic is HELL so I want something interesting to listen to.

I did set one scanner to search shortwave and was able to get some
interesting transmissions.

I recently went to Ham Radio Outlet and upgraded my antenna.
They have some really nice gutter mounts..I was going to drill some holes
but with htis I didn't have to.. I removed some screws and ran the cable under the interior
molding, then under the seat to the radio.

I have two scanners and a frequency counter as well as a CB

I will probably add an audio amplifier and switch console so I can control
which scanners or radios go through the amp. I saw a 4 channel equalizer
that might work... whenever I go to car sterso shops, the guys there
never seem to understand my application....I'm not interest in listing
to the AMU (Automotive Music Unit), I want to hear the other radios!!

JOHN

oh BTW...

PMU is Personal Music UNit.... aka walkman

Jamie,
Maybe you should check the frequency stability and radiation RF level of
your scanners local oscilator.
A pilot or airline would be foolish to allow those rf signials in the
aircraft.
The way I always hear the rules aboard the aircraft, they say no to scanner
devices.
I think that I'll write the FAA or my Senator on the transportation commitee
to clarify this.
Rick

Baby sitting monitor will fit the bill.
Cheap, and the freq is right in the middle
of the cordless phone handset freqs...
You might have to swap the crystal if
you have a particular channel in mind.....

Pick up one at wal-mart for about $30...
Or keep your eye out for one at garage sales...
I picked up two for $5.00

Sadly enough it's true...
**********WASHINGTON, DC -- High school football killed as many students last year as did guns -- which means politicians should either stop using school shootings as an excuse to attack the Second Amendment or start passing "football control" laws, the Libertarian Party said today.

"According to the latest statistics, a football is as deadly as a gun," said Steve Dasbach, the party's national director. "So why do first downs continue to be exalted while the Second Amendment continues to be vilified?"

A new study from the National School Safety Center (NSSC) reported that there were 15 "school-associated deaths" caused by violent crime -- including guns -- during the 1999-2000 school year.

That number is unchanged from the 1998-1999 school year, when 15 students were killed by guns, according to the Centers for Disease Control and Prevention.

There have been zero student gun deaths so far during this school year.

By comparison, 15 high school football players died during regular season and playoff games in 1999, according to the National Federation of State High School Associations.

Another 11 athletes have died in high school games and practices since late August of this year -- and that number is expected to rise during playoffs. In addition, another 29 players this year have suffered "catastrophic injuries" on the field, leaving them paralyzed or seriously disabled.

These numbers have Libertarians wondering: Given the carnage on our nation's high school football fields, why the outcry about guns -- and the utter silence about football fatalities?

"When 15 students are tragically killed by guns during a school year, every politician and anti-gun lobbying group expresses practiced outrage, and immediately demands new laws that infringe on the Second Amendment," said Dasbach. "But when 15 students are tragically killed by football, the silence is deafening.

"If the preventable death of any young person is a tragedy -- and it is -- then why wasn't there a Million Mom March demanding an end to high school football? Why no calls from Bill Clinton for

'reasonable' football control laws? Why no saturation media coverage as dead football players are carried off the field in stretchers? Why no class-action lawsuits against Spaulding for manufacturing cheap Saturday Night Special footballs?

"Could it be that politicians get more yardage attacking guns than attacking football?"

This "outrage gap" is especially puzzling, said Dasbach, because the Constitution doesn't guarantee an explicit right to "keep and bear" footballs.

"Football is nothing more than entertainment and sport. Guns are a Constitutionally protected civil right," he said. "While every new gun-control law triggers a fight about the scope of the Second Amendment, football has no such protection.

"If he wanted to, President Clinton could lobby for an absolute ban on high school football, in order to save the lives of 15 young people every year. The fact that he doesn't, and the fact that groups like Handgun Control, Inc. don't demand such legislation, reveals that their real motive is not to save lives, but to advance an anti-gun political agenda."

Of course, Libertarians wouldn't support a ban on football any more than they support a ban on guns, said Dasbach.

"Protecting the lives of young people who play high school football is the job of parents, school officials, and coaches, not politicians," he said. "And protecting the Second Amendment is the job of every American, since so many politicians have fumbled their duty to defend the fundamental human rights -- including the right to keep and bear arms -- guaranteed in the Constitution."

The maritime VHF channels are licensed as a band, not as individual
frequencies, so you will not find licensees in the FCC file. The frequencies
are noted in the "Consolidated Frequency List" in the back of Police Call.

From the FAF - Frequently Asked Frequencies
on http://www.strongsignals.net/htm/oak_faf.htm

Marine VHF [80.871]
[80.373]
Ch Ship Ch Ship

60 156.025
1 156.050 61 156.075
2 156.100 62 156.125
3 156.150 63 156.175
4 156.200 64 156.225
.. ..
25 157.250 85 157.275
26 157.300 86 157.325
27 157.350 87 157.375
28 157.400 88 157.425

Shore stations are 4.600 MHz above the ship frequency. In
U.S. waters the shore frequency may be used on Chs 20, 24-28 &
84-87. Chs 1-5 & 60-64 are shared with other services. Chs 75
& 76 are reserved as guard bands for ch 16.
Specific assignments include:
06 156.300 Intership Safety
09 156.450 General use by recreational vessels
13 156.650 Bridge-to-Bridge
15 156.750 Weather, notices, etc
16 156.800 General Calling / Distress
22 157.100 Coast Guard Liaison

>Jamie,
>Maybe you should check the frequency stability and radiation RF level of
>your scanners local oscilator.

That isn't my job, it's the airline's. Now if the airline has NOT said
that scanners are ok, and most haven't, then I'm prohibited from using
them on board. No argument there and that was never an issue, at least
not for me.

Delta, however, HAS approved their use (while at level cruise, same
restriction as for laptop computers). It's printed in their in-flight mag
and it's on their web site. See

http://www.delta-air.com/travel/trav_serv/bag_info/Portable_Electronics/index.jsp

But since you asked... I just let my Opto Xplorer sweep next to my Yupi
9000. It didn't pick up anything that wasn't still there with the scanner
switched off. It picks up a LOT of hash from each of my laptops.

>A pilot or airline would be foolish to allow those rf signials in the
>aircraft.

It is your privilege to believe this. Since you believe this, I suggest
that you never fly Delta Airlines, since they DO allow them when the
aircraft is at level cruise.

>The way I always hear the rules aboard the aircraft, they say no to scanner
>devices.

I fly several times each month and in the last six years I think I've
heard scanners mentioned explicitly maybe half a dozen times; the
announcement usually just refers you to the list in the in-flight mag.
Now on *most* airlines, you're right, scanners are not on the approved
list of devices, and no one I know of is arguing otherwise, for most
airlines.

On Delta, however, they're explicitly allowed. See the link above.

Whacky-Mackie keeps claiming that either there's a secret policy under
which their pilots say no to scanners even though the printed policy
allows them, or that the FARs ban them, depending on which of these
arguments of his was shot down in flames more recently.

>I think that I'll write the FAA or my Senator on the transportation commitee
>to clarify this.

If you get the right person, they'll quote Part 121 to you. Here it is in
its entirety.

TITLE 14--AERONAUTICS AND SPACE

PART 121--OPERATING REQUIREMENTS: DOMESTIC, FLAG, AND SUPPLEMENTAL
OPERATIONS--Table of Contents

Subpart K--Instrument and Equipment Requirements

Sec. 121.306 Portable electronic devices.

(a) Except as provided in paragraph (b) of this section, no person
may operate, nor may any operator or pilot in command of an aircraft
allow the operation of, any portable electronic device on any U.S.-
registered civil aircraft operating under this part.

(b) Paragraph (a) of this section does not apply to--

(1) Portable voice recorders;

(2) Hearing aids;

(3) Heart pacemakers;

(4) Electric shavers; or

(5) Any other portable electronic device that the part 119
certificate holder has determined will not cause interference with the
navigation or communication system of the aircraft on which it is to be
used.

(c) The determination required by paragraph (b)(5) of this section
shall be made by that part 119 certificate holder operating the
particular device to be used.

[Doc. No. FAA-1998-4954, 64 FR 1080, Jan. 7, 1999]

That by the way is from
http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=14&PART=121&SECTION=306&YEAR=200
0&TYPE=TEXT
, just in case anyone wants to make sure that I'm not making this up. If
you want to see more context, try this link:
http://www.access.gpo.gov/nara/cfr/waisidx_00/14cfr121_00.html
and click on the "121.306" link from there.

Note that, yes, paragraph (a) starts out by banning ALL PEDs. But then it
leaves a loophole in the form of paragraph (b), which includes clause (5):
"ANY other portable electronic device that the part 119 certificate holder
has determined will not cause interference..."

If you'll go to
http://www.access.gpo.gov/nara/cfr/waisidx_00/14cfr119_00.html (that's part 119), you'll see that the "part 119 certificate holder" is the airline.

In other words, the airline is allowed to add to the list of devices allowed to be used on board. Please note that if this reg did not allow airlines to allow the use of scanners, then the airlines could not allow the use of portable computers either.

It is up to each airline to test devices (or
trust someone else to test them) and say "yep, they're cool." Most airlines have done this for laptop computers. Delta has done it for scanners. (And NO ONE has done it for mobile phones used in flight, because there's no point, because mobile phones are barred from airborne use by FCC regs.)

(By the way, we've recently run through similar issues on rec.travel.air, where a UA FO confirmed that yes, this is the relevant reg and yes, I am interpreting it correctly.)

Anyone know the value, pros, or cons of the Regency MX-5000
scanner? I was told it was purchased some time about 1980, so it
is a bit old and probably doesn't scan as fast as some newer
ones.

Thanks,

Al

1860. New guy "scramble" questions

Newsgroup: rec.radio.scanner
Date: 2000-11-01 21:50:02 UTC
From: Bob <bob@xxknowspam.org>
Message-ID: <6e0M5.97$FG.6262@eagle.america.net>
Source record: 76658

My rural county has a central radio dispatcher that handles all radio traffic in the county for fire, police, emergency, etc. 95% of the time it is all in the clear on 460.10mHz. Occasionally I hear dispatch or one of the units say they are switching to "scramble". I then hear a characteristic garbled, clicking transmission. My questions:
1. What kind of "scramble" is likely being used in a rural, non-populace county. Is there any way to listen to this?

2. Maybe I am confused, but I swear I have heard conversations between units, both signals coming in strongly, but where one was scrambled and one was in the clear. Is this possible?

3. If they have the ability to scramble transmissions, why don't they scramble all of them. Does the scrambling process degrade the transmission in some way?

4. And lastly, although it was easy for me to locate a reference for "ten" codes, I keep hearing (on the police net) them talking about "signal 30" and "signal 60", as in "signal 30 on that vehicle". Is this likely just a completely local code system or something in wide use.

As you can tell, I am completely new to this. Just got a Uniden Sportcat a couple of weeks ago and have been having great fun with it. Also, gave me a whole new perspective on how much stuff the police have to deal with. Contrary to public opinion, they don't just eat donuts.

Bob

1864. Another PDW Update

Newsgroup: rec.radio.scanner
Date: 2000-11-01 22:33:04 UTC
From: Jason Petty <pdwpaging@ntlworld.com>
Message-ID: <3A009A20.BDC96951@ntlworld.com>
Source record: 76662

PDW V1.04 - Freeware POCSAG/FLEX Decoder for Windows.

- Decodes POCSAG & FLEX paging signals using a
soundcard or demodulator interface.
- Real-time filtering.
- Signal indicator.
- Logs messages with time & date stamp.
- Many other features.

Main changes for this version:

1.You can now select whether to display Numeric/Tone only
messages. You can also select whether to display FLEX
Binary/Hex data. Both options can be found in the filter
dialog box.
2.The description part of a filter is now displayed
underneath a filtered message(in blue). This should
save having to open the filter dialog box to find
out who the sender was.
3.Bug fixes to the new soundcard routines.

If you are new to PDW the most important thing to check
is that the "Invert Data" flag in the setup dialog box
is the correct way around for your scanner. If it isn't
you won't decode a thing.

You can get PDW from: http://www.pcapaging.ic24.net/

Best Regards,
Jason.

> Any other ideas?

First, an anal-retentive disclaimer: Transmitting on these frequencies with more power than is allowed is illegal. And I suspect your purpose is to interfere with your nieghbors' cordless phones.

That being said, a modified 6 meter amateur transciever would work wonders.

You know, it would be fun to make someone's cordless ring every so often. Would be easy to do by recording the ring signal sent from the base to the handset, then retransmitting it on the same frequency. Another disclaimer: I haven't done this, but understand how it could be done.

Message-ID: <3A00A8AE.21FC094E@inet4u.com>
Source record: 76665

Greetings,

I didn't get much response on the 20 +/- year old Regency
MX-5000. I suppose not too many folks using a 20 year old
scanner. <g> It's gen. coverage 25 to 500 MHz. but I
understand Regency has been out of business for 15 years and it
would probably be hard to get repaired, if ever needed.

Next question....Which general coverage scanner would you
recommend? Why? I'm thinking about getting one a bit newer.

Thanks,

Al

1870. Data Slicer Trouble Shooting Help Needed

Newsgroup: rec.radio.scanner
Date: 2000-11-02 00:09:55 UTC
From: kjohanne@bcpl.net
Message-ID: <3a00af44.9685733@news.abs.net>
Source record: 76667
Cross-posted to: alt.radio.scanner,rec.radio.scanner,alt.radio.scanner.uk

I built a 2-level data slicer a few years ago and it worked fine on my old 486. When I upgraded to a K5, it worked there too. Now I have an Athlon 650. Great PC, but it won't communicate with the slicer.

I ran test utilities and verified that the comm port works (plus I'm able to operate other devices on the port). And I double checked the slicer with my older machine. Still works. I even went as far as to supply an external power source so the slicer doesn't rely on power from the comm port. Still won't work with my Athlon.

I'm trying to use Trunker.exe and MDT Monitor. No signal is seen by either when run on the K7.

Any ideas?

Gordon, N3FLF

1871. PRO-92B Still a Loser (IMHO)

Newsgroup: rec.radio.scanner
Date: 2000-11-02 00:36:45 UTC
From: chuck@nospam.latraffic.org
Message-ID: <3a00b3da.4156808@news.uia.net>
Source record: 76668

The other day I went down to the local Radio Shack store and picked up a new PRO-92B. While I was not at all happy with the original 92 last year, I decided to take advantage of the sale and give the newer model a try.

The first thing I did was to turn the radio on and press "3" during the WELCOME message to display the firmware version. I did indeed have a radio with the latest (3.28) revision. I programmed it and found it to be almost ecactly as bad as the original 92 (v1.00) I had before. I missed many of the conversations on the local systems. I was told at one point that the systems in my area (San Bernardino County, CA) were very busy so I tried my side by side by test at 6 AM and at four in the afternoon. I setup the 92B, a BC895, and a PRO-90 while running Trunker so I could verify the traffic on screen.

The results of the test were as I expected. At least 30-40% of the calls were missed on the 92B. The Uniden scanners operated flawlessly. Not one missed call on the PRO-90 or the BC895.

After another day of thinking it over I drove back to Radio Shack and returned the radio. I expressed my dissatisfaction to the guy at the store, who BTW seemed brighter than the average guy at Radio Shack. He gave me a speech about how they are commited to keeping their customers happy. At that point I suggested they go back to having their scanners manufactured by Uniden and forget about GRE.

Anyway, I'm interested in hearing from others who've had similar or perhaps completely different experiences with the PRO-92 A or B models. I may forward my post and some of the responses to RS so they can be used toward their quest for customer satisfaction.

Thanks...

I had the same experience with the Pro-2067 compared to my BC-895XLT. However, my Optocom w/ Scan*Star Deluxe works quite well (GRE front-end, Optoelectronics controller).

The Pro-2067 was returned and now I'm waiting (like everyone else!) for the BC-780XLT. I hope it arrives in time for Christmas!

Actually Glen is correct, it is considered poor taste or rude to
post HTML in these text newsgroups.

The only thing I'm "missing" is bandwidth-wasting, top-posted drivel
from idiots who don't have a scintilla of a clue as to how things are
done on UseNet. When I want to surf the web, I use a browser like NS
or MSIE. When I want to read news, I use a newsreader like Agent.

These morons who have items for sale or for auction don't care about (or too dumb to understand) Usenet convention as to what is/is not appropriate on a newsgroup. They spam any newsgroup they think might help bring in a buck. Discussion groups should not be cluttered with FA or FS ads and FA and FS are two different things. FS is an item that is For Sale at a stated price, FA is an item that is For Auction up for bid to the highest bidder.

Well, since Tandy changed their corporate name to Radio Shack, then, in a roundabout way, you are right. TANDY isn't selling scanner crystals (since Tandy no longer exists).

>Damn, yall are stubborn assholes.

Yeah, but we're stubborn a**holes who happen to be right. The fact remains, if you want to buy crystals for your Regency, Electra, or compatible scanner, go to Radio Shack, look them up in their RSU catalog, and if they are listed, pay for them and they'll be mailed to your house by RSU.

And besides, you have changed your screen name. It was TW with a copyright symbol after it, now it's tw with some other strange symbols after it, a degree symbol and something else.

While I don't have the address handy, go to the Nat. Weather Service website, and look for a link to the EMWIN page (Emergency Managers Weather Information Network). They have (or had) a data slicer circuit and construction info. You might want to look at the lists and see if EMWIN is rebroadcast in your area. Great 24 hr. weather info, watches, warnings, etc.

And if you don't feel like building your own data slicer, the Nov. RadioShack.com flyer has the Vectronics data slicer with JVFAX/HAMCOM software for Fax/SSTV/RTTY decoding on sale for $29.95 P/N is 940-0685. This is NOT the store sale flyer, this is the old TechAmerica flyer, now called RadioShack.com.

My personal experience: Ansett = Yes, Impulse = NO!!!!.

My tips:
* Use it while waiting in the terminal;
* Use an earpiece;
* Put it away before you board;
* Read the aircraft notices re electronic equipment;
* Don't get it out until after takeoff, and the plane has levelled
off;
* Use it discretely;
* Don't spill drinks on it;
* Panic when you hear the Captain call May Day. You may have to BYO
Panic Button.

No TW...you have a serious problem with finding arguments on the most petty stuff.
You are a disgrace to all those hard working people that carry badges and practice
good verbal skills and wit in the field. You say you a cop??? Fucking scary!!! I
have seen assholes like you on real tv.
Just a guess here...
Your divorced...
Live alone...
Close to retirement or already retired and still faking it...
Have 2 friends that you fish with...
Own a ford pickup truck... probably a '95
Your phone bill is under 30 dollars a month...
Never got above SGT.
Had one questionable fatal shooting...that got cleared...but you KNOW you dusted the
guy for little reason...
And kids.....
Let others guess that one...but that low phone bill is key.

DISGRACE!

Hollister is Dispatched by the Sheriff's office on 158.775 (pl 146.6) it has real good range...the SO and PD share the channel 157.750
for tac and 151..025

All county fire units are on 151.250 CDF Monterey dispatch.(former King City)
The defualt tactical is CDF Tac -7 151.340

Radio shack used to stock a standard tv set replacement cord that worked
great.

1896. Re: Building or buying a transmitter on cordless phone freqs?

This is all kinds of fun!
Get a 100 watt Motorola,Midland or GE programmable low band VHF two way used....put the 25 output frequencies and monitor the input channel on a scanner. this way you can interrupt the conversation with facts gleaned from the scanner. I do this near a hi rise condo with all kinds of single chickies...I know the girls get turned on by it. They might sound angry...but it sounds like love to me.
The whole setup runs about 300 dollars on the high used side. I also have a 99 channel low band MT1000 that works when I need to be stealthy...like when I'm looking in windows at night.
There ya go...strait foward on topic info that you can use!

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2042 and PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published on the CARMA email list, carma@qth.net. You can obtain a free electronic subscription to the CARMA email list. For more info, see:

http://www.qth.net

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Most meetings are be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner. The author writes a monthly
"Scanner Equipment" column for Monitoring Times magazine,
published by Grove Enterprises, but views expressed in this
article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies
is the Police Call Plus, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

You can query FCC databases directly from this web page: http://www.fcc.gov/searchtools.html

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://w5gb.nmsu.edu/kc5kto/,
http://www.fordyce.org/scanning/, and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'.

(See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of

information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army

Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each

equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

Uniden sells refurbished scanners dn you can check current inventory at their web site:
http://www.uniden.com/docs/store

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120
Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the ICOM IC-R2, Uniden/Bearcat BC3000XLT, and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 2000 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229, email: electra@tcon.net,

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor

controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 2000 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are

cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise

burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a

tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly

compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents

4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage

to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are

backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test

unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR

scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be

programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image

rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The

Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per

channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date.

Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search.

No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. For a service manual, call SONY at (800)488-7669, and press 3. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you

find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes

FR2526 10 X X yes yes
FR2527 10 X X yes yes
FR2528 10 X X yes yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and

wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

I have the same problem. But I am trying to find an antenna that will help.
Also I plan to do the squelch mod. But for $199 - 20% discount for signing
up for their credit card which I will throw away, for a total of $159.99
it's not bad.

Hi! Has anyone had any experience with this scanner? I would like a basic synopsis of how to program it. I have tried various combinations but with no luck. I need to know if I am programming it right or if the front end is down. Any help would be appreciated. Please reply or email Steve at turbo22367@aol.com

Thanx

In north Galveston County, you used to hear Life Flight talking to the guys on the ground on the fire mutual aid frequency (154.28).

I haven't heard them in a while.

Are they
A- still on 154.28?
B- on another frequency?
C- on a Galveston County trunked system talk group?
D- other?

I've got some plans and photos on my web page. There are many different designs. This one works well for me. Don't ask me for help though. Each one I have build never works the first time. I average about 5 dumb mistakes per slicer.

http://n7olq.home.att.net/Radio/Slicer.htm

About the Athlon... rip that paperweight out and put in a Pentium! :-)

Filters? I don't have no stink'in filters!

Try using the two video units (Eric can use his ears) inset into your skull and the sponge full or neurons behind them to do your filtering. You really don't need Microsoft, Netscape or Agent. Be a man. Filter it the manual way. If you don't care for the subject or Author just go to the next message.

I deo admit to filtering HTML with my reader. Easier on the eyes.

Sure i can, stop being lazy , and DO IT. I filter them by their address, and dont even bother telling me it doesn`t work, because it does. The agitators you are talking about are only one or two, that regularly change their address, and the others dont. So what is the problem ? You cant add their "new" address on from time to time ?

Stop acting like the whole world is going to change the way it works, just because you dont like it. Stop acting like bitching about it endlessly is going to put an end to it all. It isnt going to. I have successfully filtered these idiots for years, and it has worked for me. Most of the time, i can scroll through this news group, and i dont have to see even one idiot agitator, or a reply to them, either. Remember, people that reply to the idiots, month after month, are every bit as irritating as the idiot himself, and need filtering just as much as the agiatator does, if you are going to have peace and quiet. . .

Another problem is that some people are just inherently "nosey", and cannot leave the filters on, even though they have them programmed. They will leave them on for a couple days, and then they reach the limit of their endurance. They just HAVE to know what is going on with the dinkweeds. And, sure enough, within a few days, they are back to replying and replying and replying to the moron. Are you one of these people ? Then stop bitching. You bring this upon yourself. Program the filters, and then LEAVE THEM ON. Too bad about posting at the top. This is the easiest and quickest way to read the reply. I like top-posters. I dont have to scroll through every damn thing I have already seen to get to the reply ! like most of life, it is all in your point of view, isn`t it ? The fact remains, bitching about the problem is not going to solve it.....

Are the software packages run in DOS?
if so - then you have to run the PC from the F8 & command prompt at start-up and change to the directory that the program is in, and run it's executable command.....

Win 98 DOS will not recognise a comm port! works ok in windows, I found this out when Radioraft wouldn't run on my New Athlon machine - works perfect now still using same interface....
Happy Scanning

I can't speak for your particular application, however I work for a
water company and we have similar devices. These meters are polled by
a guy driving a sedan up and down each street. To my knowledge, they
do not broadcast. They must be interrogated.

The frequencies often vary. However, we found it most expedient to
use unlicensed part 15 frequencies...

At least two large ISPs (one is Earthlink) filter out HTML posted to
text groups, so anyone who posts in HTML is not going to reach nearly as
large an audience.

1939. How do I use a Cobra SR10?

Newsgroup: rec.radio.scanner
Date: 2000-11-03 00:00:00 UTC
From: Sir Mildred Pierce <mildredpierce@my-deja.com>
Message-ID: <8tvfab$5a0$1@nnrp1.deja.com>
Source record: 76710
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I do not know anything about scanning, I got my first scanner today, and it is an old Cobra SR 10. There are about 10 frequencies in the town that live in (Nome, Alaska) and I have no idea how to program the frequencies into the scanner.

There are some buttons on the scanner: "WX", which seems to bring up a weather station. "L/O" which seems to lock out frequencies for scanning. "REV" which when pressed flashes a series of numbers three numbers, a dash, and then three more numbers. It seems that this might be showing the frequencies that are programmed into the scanner, but the numbers they are flashing are way out there and don't seem to coordinate with any of the local frequencies (which are all in the 155-162 range). There is a "scan" button and "manual" button, and those were easy to figure out, but I don't know if they might do more than what is obvious. There is a number pad with 10 numbers, a decimal, and an "E" and I have no idea what the E does. There is a switch that says "KEY LOCK" and "OFF" and I have no idea what that does.

Well thats about it. I looked around and I couldn't find anything online that really explains how to use the scanner, so I would appreciate any help that I can get. If you want to respond on the message board, I'll be checking in, but please cc: me a copy at sir@bananadine.com .. thanks...

Looks like you basically have it figured out.

WX is indeed the weather button, and pressing it scans the NOAA weather
station frequencies.

L/O stands for "lock out", and pressing it on a memory channel will prevent
that channel from being scanned.

REV stands for "review," which shows you what frequency each particular
memory channel contains. When it shows, say 1,5,5,-,5,3,5, the actual
frequency is 155.535.

E stands for "enter." To enter a frequency into a memory channel, you enter
the frequency and then press E.

KEY LOCK locks the keypad so no data can be entered by pressing any keys.
Pressing it again will unlock the keys.

From: "Clifton T. Sharp Jr." <clifto@clifto.com>
Message-ID: <3A036550.5E5C76E1@clifto.com>
Source record: 76716

Up near O'Hare, I've been picking up what has to be air traffic control
on 154.400. I'd call it an image, except it's very definitely FM! Traffic
such as:

"American 1147, O'Hare."
"American 1179, O'Hare."
"Contact departure on one two seven point four."
"American 47, fly a three zero zero heading for a bit."
"American 47, thanks, you can turn two seven zero now."

and runway numbers, headings, altitudes and ATC frequencies to switch to.
Any ideas what this might be?

A modified Kenwood TS680 will transmit a bodacious signal here - after modification. Some newer, and more expensive, rigs will transmit much more powerful signals in this band.

This could be illegal where you live so be sure to check local laws.

I wouldn't pay for any Xtals at all. 16 Xtals are gonna cost you at least 160$. Get rid of the scanner and buy a synthesized unit. You'll be glad you did. Even the crappiest, old synthesized scanner will blow yours out of the water.

A easy way to check it is by using dos program, and using hslicer.exe. it works great for testing the comport. are you conflicting with a mouse or a modem?

In canada it is not illegal to listen to anything you hear on your scanner. you can listen to fire/ems/cell and so on. The only time that it IS illegal is if you disclose the info you hear or if you rebroadcast like you were doing. those are mostly what Industry Canada gets mad at. if you listen to it for personal use and not recording, descrambling and so on. it is legal.

I have a very good condition PRO-43 that hasn't been tampered with. It
covers the following bands:
30-54 mhz
118-174 mhz
220-512 mhz including military aircraft band
806-999.9875 mhz with 2 gaps in the cellular band.
It has 200 memories.

If you remove a single diode, you can get the full cellular band back.
Comes with instruction manual, original box and instructions for all
the mods available for that model. Asking $200. U.S. shipping included.
Inquire by email if interested.
Regulations forbid shipping c.o.d. to the U.S. and PayPall is not
international. Other arrangements can be made and I can give references
in the U.S. an Canada if needed.

Go to Radio Shack. Ask for a Colon Cat. When the droid asks for your name, tell 'em you are Jeffery Jovan Philyaw* of McKinney TX. Scan to your heart's content, but don't use the disk they supply. That gives them the right to take back their 'Free" colon cat.

*CEO and Flouder of Colon Cat parent company Digital Convergence.

It is a device that looks like a small cat (abut 5 inches long). It plugs into where the computer keyboard goes and has a Y connector so you can hook your keyboard back up. While on the internet It is used to read in the barcode (UPC) found on most products boxes. It will then take you to the website if it is listed in a database or will send you to a place where it asks you to input some info so they can look for the product and then put it in the database.

It has been advertised for free at your local Radio Shack store. Got mine there. They have a catalog with many of their products in it and the barcode beside the product.

My power company recently switched my meter. The new meter is an automatic-read meter. I guess it sends out a radio signal to a van that drives by. Some questions. (1) Do these typically send out a continuous signal or do they need to be prompted by an incoming signal which they then "answer"? (2) Are readings taken this way typically readings at an instant or are they continuous readings which might reflect rate of usage over a short interval? (3) What frequencies are typically used and is it possible to read my own meter electronically?

Well all depends what province you are trying to enter. each province has in a figure of speech Different laws. If you have ham gear and you don't have a valid ham licence, It all depends on the province you are entering. Some are way more strict then the others. I travel between BC and the states often. but I do have ham licence plates, they don't bother with the radios. radar detectors. I think manitoba and another province don't allow it. Last time we went thru back to canada. the US customs stopped us. did a search cause they thought we were bringing drugs. their search was peeking in the windows. If you don't ahve drugs. all should be fine. but I ain't no customs. things change.

I agree, if it can be removed in the cold, do it. I don't hav emy scanner in the car. but I have my mobile ham rig in it. ham rigs take more power then a scanner does. the only think I ever noticed with all my radios that have been in the car is that it scans a bit slower till teh radio and LCD warm up. Never had one break though yet.

Why do you want them to kick you out of the program? Wouldn't it be easier
to just quit?

If they won't, they'll no doubt can you if you carry any other radio that
can... and if you mean to TRANSMIT, that's a federal crime.

Start on 14.230, there is a SSTV net there every day. A few folks
might shift a little up from there as well, say around 14.233 or so.

1984. Re: New guy "scramble" questions

Newsgroup: rec.radio.scanner
Date: 2000-11-03 12:13:36 UTC
From: Raven <spook7nospam@netzero.net>
Message-ID: <3A02ABF0.8C8E0C54@netzero.net>
Source record: 76731

I'll only address the codes subject.
Around Nashville they use 3 TYPES of codes.
1. Signal Codes which are related to communications in some way,
Example: Signal 2= Call the station Signal3= change channels

2. 10 Codes. Different codes for almost anything.
Some duplicate the signal codes but not many.
Some are pretty much universal 10-4 means OK/Yes almost worldwide.

3. Plain old "Codes"
The code 30 you were referring too probably means "Disregard"
Most of the codes can be figured out with a little reasoning power.
For example if a dispatcher says theres a 10-45 out on highway 30
it can only mean about 3 things. A wreck with injuries, A wreck with no
injuries, Or a stranded vehicle....

Some codes can be used interchangibly with several meanings.
For example here code 23 means a bldg is secure (windows and doors
locked)
but the dispatchers also use it to ask officers if everything is ok with
them at the moment, especially if the officer has been out on a call
for quite a while and hasn't called in to report his status.

Theres a catch to that in some places. Here you answer yes I'm code 23
meaning I'm ok. But in the county the correct response is NOT the same
one...

So just listen and think about whats being talked about and you can
usually figure out most of the codes...
Some very seldom used codes like one for a airplane crash may never be
used....

(and probably the officers wouldn't remember it either :o))

Yes, the CT-29A cable works with the FT-10/11/40/41/50/51, VX-1/5, and VR-500. The FT-10/40/50 and VX-1/5 radios also require the little CT-28A 4 pin adapter. Just remove the adapter when using your cable with the VR-500.

> Thanks

Such a program would be difficult to design. LTR does not use a control
channel, but transmits the trunking information subaudibly on the voice
channels. A MultiNet program seems doable, however, because that system
does use a control channel.

Interestingly, the introductory paragraph says absolutely nothing about 12.5
or 8.3 kHz spacing plans for the VHF aero band. It assumes total allocation
of all VHF channels based on the current 25 kHz bandplan, which is obsolete.

wrote:

>If Mr. Oyen choses NOT to respond to YOU, then WHY are
>you re-directing your issue with Mr. Oyen to ME?

I didn't (and don't) have an issue with Mr. Oyen; I had an issue with his opinion about what the FARs said. We already dealt with that once and showed that the FARs don't say what he thought they did. However, you quoted his opinion as if it was still establshed fact, so a followup to you was reasonable and appropriate.

Usenet has been compared to a big cocktail party -- with logging. Ok, suppose we're at a cocktail party and you say, "I heard an editorial on a TV news show that said we should build solar power plants in San Diego to relieve the high electric rates." Now I happen to know (from simple arithmetic and a fact or two, like that the solar flux is good for about 1 KW per square meter, AT BEST, and that only for a few hours each day, and land around here isn't cheap) that trying to replace traditional power plants with solar is a really silly idea. So whom do I talk to? Do I run to the phone and call the station? (I *did* respond to the editorial in question, but that's a whole other issue.) No, it's you and I having an informal conversation, so I respond to you.

Which brings us to --

>I NEVER initiated the discussion with you.

Sure you did. Your post immediately followed mine in the thread; your news client autoquoted and cited my post, and were directly and obviously responding to words in my post (the bit about "made-up facts"). The quotation and the structure of your comments made it obvious that you were responding to me, so why shouldn't I respond back to you? After all, Mr. Oyen wasn't the one who said anything about "made-up facts", I was.

Also, it is obvious from your "References" header that you were following up to my post. The last item in the "References" header in YOUR post, is the message ID of MY post. That means it was MY post on your screen when you hit the "followup" command. QED.

To any reasonable person, that's "initiating the discussion with me".

Since you cited Mr. Oyen's post as a basis for your belief, more or less in passing, I mentioned, also in passing, that his belief about the FARs had already been shown wrong. It's just like when Mr. Oyen wrnogly cited the FARs, I responded to HIM, not to the FAA. In this case, I responded

to you, because you're the one who made the most recent statement, and
it's ME responding to you, because you were responding to *my* post.
Clear now?

My local Shack had four of them and they were all the old version. I bought one for the alpha tag sysytem. It works okay but has a slow scan rate. The 91 is a great one if you are not interested in the text tags.

It's an image. Aircraft/Tower transmissions in AM are readable on FM
scanner image frequencies. Very common in some brands of scanners.

>Please direct your issues with Mr. Oyen & leave me out of it.
>

If you'd bothered to read the followups to Mr. Oyen's post, you'd have
found that I'd responded to him already... after which he said nothing...
so that was a closed branch of the thread at that point.

Having apparently not been aware that the FAR issue was settled (and
settled NOT in Mr. Oyen's favor), YOU reopened it (as clearly seen in the
text of yours that you so conveniently quoted above; thank you!), so I
responded to YOU. It would have been pointless for me to post that
response as *another* followup to Mr. Oyen, since he didn't write the post
to which I was responding at that point.

If you want to be left out of it, the way is clear: Don't you get into it
in the first place. Certainly not by referring, for supporting arguments,
to opinions already countered by facts.

Are you sure you heard the Int. Space Station? See the following excerpt
from the ARRL Newsletter for Nov. 3rd, 2000:

"The crew has a busy schedule that primarily involves getting the ISS up and
running for future research activities. Amateur Radio operation is not
expected to commence until mid-month, although the crew is said to be
enthusiastic about firing up the initial Amateur Radio on the International
Space Station--or ARISS--gear. Once installed temporarily aboard the Zarya
module, the equipment will provide FM voice and packet capability on 2
meters.

Tentative operating frequencies are: Worldwide downlink for voice and
packet, 145.80 MHz; worldwide packet uplink, 145.99 MHz; Region 1 (Europe)
voice uplink: 145.20 MHz; Region 2 and 3 voice uplink, 144.49 MHz. Crew
members may use their personal call signs or one of the "club station" call
signs issued for ISS use--NA1SS, RZ3DZR, or DL0ISS."

According to this, the ISS is not using their amateur setup, nor is the
freq. you heard listed. Don't know, is there anybody on Mir at this time?

Mark,
143.625 is a freq used on MIR and not a ham radio frequency. The USA set up a few ground stations when our astronauts spent time on MIR. Also the orbit and Doppler effect all were in sync with Alpha. The comms on 143.625 are shop talk IOW, men at work.

Woops again (silly me) my previous post was pertaining to the discussion about
whether scanners could be used when in flight...
My apologies to Mark he is way 'on topic'
I clicked on the wrong message when I was replying..
Anyway as I was saying..

Snnnnzzznznzz (The sound of me snoring!!!)
This post is way off topic and getting really boring and also junking up my news
client krud posts.
Please finish your discussions on mid-air scanning soon....
Thanx

Message-ID: <I%jN5.20326$%j.6524448@typhoon.southeast.rr.com>
Source record: 76564

Hello Bj&#65533;rn Danielsson ,
I have had my R-10 only a short while but anyway I will try to
elaborate on your Auto Memry Write Scan (AMWS) question.

This AMWS would be a good function on the scanner to use while you
are away from it or while you say balance your checkbook and
want to learn of frequencies that are in use in a certain segment
of a frequency range.
Sort of like a record while you are away VCR mode.(well it's some
sort of analogy !)
This is a mode that should be referred to as a search mode
but ICOM seems stuck on the term scan.
This is a scan (search) mode of any one of the 20 scan (search)
limits that automatically writes the frequencies that the radio
stops on to BANK "Q "as a memory channel.
This is treated as a scratchpad memory, so therefore, before you
start the AMWS scan(search) be sure to save those memories in BANK
" Q " as they will be overwritten during the next scan(search).
If this is your first use of it don't worry.
The R-10 must be in the VFO mode initially (V/M) then you enter
(FUNCTION) +(5 / AMWS)
You must then select the scan(search) bank that you want to scan
(search).This is a number that is between 0 and 20 and these ranges
must be preprogrammed for this function to work.
Using your top tuning control knob rotate it through until you find
your desired scan(search) bank.
As you wait after selecting the number 0 to 20 the Start and End
frequency limits will now be displayed to show you the intended
search range.
If this is what you want to search you press the (SCAN) key.
Now the decimal between the frequency will flash indicating you are
in the Auto Memory Write Scan.
As it scans(Searches) the number to the left of the frequency will
increase each time after the scanner stops and then resumes scanning.
This is indicating that the frequency that the scanner is stopping on
is being automatically written to your BANK "Q" as a memory channel.
When BANK "Q" reaches the limit of 100 stored memories the AMWS
will stop.
Now you can access these through your Memory mode to scan these
or transfer them to the BANKS "A through P"
There is a feature that lets you delete the frequency that you do not
wish to store on the fly as you are in the AMWS.
I don't know when this would be handy to be honest.

Hope this helps,
Eddie Bryant N4UMJ
North Carolina, USA

I *didn't* follow up to you re. "an issue with Mr. Oyen's statement". The
issue with Mr. Oyen's statement had long since been dealt with.

I followed up to you because you believed that his statement was correct.
It was your belief I was addressing, not the source of the belief. So why
shouldn't I followup to you?

So let's see: First you claimed a "policy of the airlines" directing the
pilots to disallow scanners -- it doesn't exist. Then you claimed the
FARs explicitly disallowed scanners because they weren't "specifically
designed for use on aircraft" -- that's not true either. So in a
desperate attempt to be right about SOMEthing, you claim that I'm arguing
with you inappropriately. That isn't true either -- see above. What's
left for you here to fall back on, in your desperate attempt to be right
about SOMEthing? You'll find I don't leave you many spelling errors to
pick on...

I was amazed to see that Optoelectronics wants $15 (!!!!) for a
reprint. The Scout manuals are these little dinky things that would be
about 100k in PDF format. Most companies let you download manuals
right from their web site, too bad Opto dosen't.

Good luck,
Barry

Jeff,

Do you get this message only when scanning a trunked group in bank 9? I get the same message and have been told that it is because bank 9 is used for storing frequencies found during a search and somehow the message is being tripped . I have not tried to verify this by reprogramming bank 9 to another bank. That would be easy to do with software, but I don't have the software.

It doesn't appear the message is causing any problems in my scanning of that or any other banks.

Useless data removed because it shows your position to be absurd, you
mean.

OK, for the really mentally slow, I'll rephrase: In the CURRENT branch of
this thread --

1) you followed up to me.

2) therefore, I followed up to you.

All.

2064. Pro 92A difficulties

Newsgroup: rec.radio.scanner
Date: 2000-11-05 03:11:23 UTC
From: "Jeff Adams"
Message-ID: <urj90tsjvipbdq7mkg1bnu0olkov3vb6mq@4ax.com>

For the life of me I couldn't get my 2067 (which I returned) to properly trunk NASA Ames (I'm in the San Francisco Bay Area). Now the $199.99 price sucked me in so I got a Pro-92A. Same problem. On NASA Ames, I frequently get at least two of the EDACS trailing tones after speech has ended. And it seems as though it almost always jumps to the next bank without any kind of delay (whereas with Santa Clara and Alco, there is usually a short delay). I know how to program EDACS since I can successfully track Oakland.

Could someone who is successfully using an A or B model Pro-92 or a 2067 please tell me if they can trunk NASA Ames properly? And if so, would you be so kind as to list the frequencies in their proper order? I don't have the radio in front of me or I'd tell you what I'm currently using (I've got the yellow GRS trunking book and used those freqs in that order).

Another problem I'm having with Santa Clara (city of) trunked system - I get the "All channels locked out" message about every 3rd time the scanner scans that bank. Have they changed something recently (again, I have what I think is the latest GRS yellow trunking book and am using those freqs)?

Can someone with a Pro-92A or B tell me what freq's they are using, and if anyone else gets that message "All channels locked out", perhaps you could provide me some tips on what to do?

As far as I can tell I have the banks for NASA Ames (see previous post) and Santa Clara properly programmed. Given that I can follow ALCO and Oakland, I _think_ I've got everything programmed properly...

Thanks in advance,
Jeff Adams

At least you didn't key up the transceiver with the out of band mod and started calling "CQ CQ CQ Alpha de K5MAR!"

Don't be too hard on yourself. I went this route a couple of years ago when I was trying to make contact with MIR. It's always the simple things!

A look at the high-level features make these look similar, but the detailed features make the 780 a hands down winner. Unless the 780 has bugs, the 2067 won't even come close to the flexibility and performance of the 780. From what I have seen the 780 will be in the $360 range

Once the station has been set up, such days off are a good moment to
listen. I just doubt that they will spend their time off doing exactly the
same thing (locating cables, finding the place to plug them in) they have
been doing all week long...

I am looking for technical information on the Roanoke Virginia City/County Motorola trunking system. Specifically, I am looking for the Motorola System ID (SYSID) and control channel frequencies.

Thanks

John

My local police department scrambles some of their transmissions using what they call "code" or "code-s". When they use it, it sounds like the squelch is turned down all the way. Does anyone know what type of scrambling this is and is there a way to unscramble it?

If you here "rushing" noise as if the squelch is wide open then they are using some form of digital scrambling. As things stand now, real-time decoding by anybody other than the CIA, NSA, etc. is not possible, nor is off-air decoding likely within a reasonable time frame, unless you happen to have a spare Cray supercomputer sitting around that you could use.

Two suggestions. First, go to Radio Shack and get their No-Code Technician license manual. Be sure to get the new one with the April, 2000 rules changes. Although the changes had little effect at the Tech. level, why pay new price for last year's edition. Second, go to the ARRL website http://www.arrl.org/ and look at the top of the page at the search box. You'll find links to exams and clubs. Look for a club in your area and contact them. They may have study classes and/or other assists for the want-to-be ham. You'll want to establish a relationship with the club in your area as it'll probably be their repeater you'll be using after you're licensed. It just makes good sense to join the club and help support the system. And that way you'll get to meet the other hams in the area, some (many) of whom are willing to help a newcomer.

I have been an accreditated amateur radio license examineer for over
10 years, so please allow me to give you one piece of advice. Get the
ARRL book called "Now You're Talking". I have NEVER seen ANY
adult who throughly studied that book fail getting their Technician class
amateur radio license.

good luck!

Greetings; On a recent trip to Victoria BC, I took my Yaesu FT470 along with me. Had absolutely no problem with it entering into BC. When I returned to the U.S. via SEATAC in Seattle, U.S. Customs asked me to remove the battery. They then asked me to insert the battery and turn the radio on. The agent then asked me to open the squelch. Last but not least, he then asked me to produce my license to operate the radio. Fortunately, I had the wallet sized copy of my license with me.

2109. IC-R7100 discriminator help please

Can anyone tell me where the discriminator tap point is on the ICOM IC-R7100? I have looked at various lists of modifications but this radio is not mentioned.

Thanks in advance,

Pete.

Found it at www.mods.dk the best mod. site !!!!!!!!!!!!!!

This is an involved operation and should NOT be attempted by anyone who does not feel at home with fine electronics work. It is very easy to do serious damage to your radio if you don't know what you're doing.

Please read through this document in its entirety before attempting to carry out the modification.

It is almost essential that you print this out in order to have it handy while carrying out the modification. The diagram at the end of the article will be of great use.

Right, let's get down to the nitty gritty.

You are going to need just one electronic component - a capacitor of a value of between 220n and 10u. It can be either polar or non-polar. In addition, you will need a length of screened audio cable, any type should work but the smaller it is the better. You will need some form of connector to put on the one end of the screened lead - a minijack socket or phono connector would be good.

Of course you'll also need a few basic electronics tools such as a screwdriver, soldering iron, sidecutters etc.

With the front panel of the radio towards you, as you would have it for normal use, locate the four retaining screws on top of the top cover. These are located near each corner. Remove these four screws.

Do not remove the three screws located around the speaker grille.

On each side of the radio are two further retaining screws (a total of four). Remove these.

The top cover may now be lifted off the radio taking care to observe the speaker cable. The speaker is fixed to the inside of the top cover. There is a connector in the speaker cable which should be unplugged to free the top cover completely.

Looking down on the receiver, locate the converter unit. This is the PCB closest to the external antenna connector at the left rear of the receiver.

Now locate the coaxial connecter at the extreme left rear of the converter unit PCB (see diagram). The cable connected at this point bends over and travels downwards into the bottom half of the receiver.

Disconnect this cable by pulling directly upwards. The connector is farily delicate so do not use too much force.

Now comes the part that requires great care. Take it slowly and do it properly.

The entire top chassis has to be detached in order to reach the main unit PCB beneath.

There are four screws that need to be removed to accomplish this. Two of these are located on the rear panel of the receiver.

Looking at the radio from the rear now, you will see a row of connectors for such things as external speaker etc. Just next to each end of this row of connectors are the two screws you need to remove. Remove them.

The remaining two screws are on the top of the unit. Position the radio as you had it before (normal operating position).

Looking down on the radio, you should see four screws near the front. Two of these go through the top of the plasic front panel and two of them go through the metal chassis (see diagram). Remove the two screws that go through the metal chassis.

Now CAREFULLY lift the top chassis and swing it clear of the radio. Note that there are many wires linking the top chassis to the bottom. Take care not to strain these. there should be enough slack (just) to allow you to swing the top part out and away from the bottom and lower it onto the surface you're working on.

Now you should have a clear view of the main unit PCB. This is where you will be making a connection.

In order to locate the point on the PCB where you will connect the screened cable you will need a ruler or tape measure.

The connection point is approximately half way from the back to the front and approximately one quarter of the way from left to right. This is just to give you a general idea of where to look. (see diagram)

Now, using your ruler, measure inwards 55mm (2 1/8") from the left edge of the radio towards the right. Imagine a line running through this point from the front of the radio to the back.

Now, measure 120mm (4 3/4") from the rear towards the front along the imaginery line.

At this spot on the PCB (see diagram) you should see a wire link marked "W100". This point (the wire link) is output of the discriminator.

Connect one side of the capacitor to this wire link. If the cap is a polar type then the positive lead goes to the wire link.

Connect the remaining lead of the cap to the centre conductor of your screened cable.

The screen of the screened lead can be soldered to the casing of the nearest metal can. There is a suitable can approximately 10mm (3/8") to the rear of the wire link (see diagram). Take care not to overheat the can while doing this. You should be able to get the solder to flow nicely onto the can within two or three seocnds.

Exactly how you terminate the other end of the screened lead is up to you but I would suggest that you extend it through a suitably drilled hole in the rear panel of the radio and then terminate it on an in-line mini jack socket or phono connector.

That's it! Well, almost. Now you have to reverse the whole process in order to close up the radio again.

Be extremely careful not to strain any of the wires and take care to ensure none are pinched between metal chassis parts as you close up the radio.

Don't forget to reconnect the coaxial lead at the left rear of the radio once the top chassis is back in place.

The new output you have created is basically just "raw audio". It is the point in the circuit before audio filtering, volume and squelch control. This means that it is a fixed level output unaffected by the position of the volume and/or squelch controls.
Be aware that while short circuiting this output shouldn't cause any harm at all, it will deprive the radio of an audio output thus muting the internal loudspeaker. The impedance of this output is around 10k which is perfect for driving the circuit supplied with the software PD.EXE (a pager transmission decoding utility) but may require buffering if you plan to use it for other purposes.

Anyone requiring further assistance is free to Email me at tim@pixie.co.za. I'll do my best to help.

This diagram shows the relative location of various key points within the receiver. Be aware that the points shown are all inside the radio and that some are visible only once the upper chassis has been removed.

Source record: 76586

I have a SportCat150 handheld with built in Ni-Cad battery pack. Nothing in the manual about care of these batteries. Is it best to let them run completely down, then recharge fully? I've read that some Uniden scanners have an undocumented way to monitor battery level, but that does not seem to be the case with the SC150. This is a real nuisance - I leave it on all day both on batteries and on the charger and I never know what my battery level is. How damaging is it to Ni-Cads to leave them on the charger too long? Anybody out there found a good solution to the problem of not knowing what your battery level was?

Thanks for your help

Bob

With the manning of the International Space Station has come new activity on the Russian Space Programs VHF downlink frequency, 143.625. NASA has tracking stations on both coasts to talk with the ISS when they pass over these sites. Keep track of the station via a tracking program with the latest kep elements for ISS or the NASA channel and monitor 143.625. You will hear russian language downlink when they pass over. I was able to monitor a horizon to horizon pass at my QTH in the northwest with a discone antenna and my BC230XLT handheld scanner. If you monitor and watch the NASA channel you can get a translation of the conversation. Also listen for Amateur Radio activity starting in the near future on 145.800. Have fun monitoring, Scott, KA7FVV

Unlikely that amateur radio activity will start very soon, given the fact
that they complain about the high workload setting up essential systems
right now. Wait until after the next cargo shipment and shuttle visit,
I think.

Jamie,

Almost all of us on the newsgroup recognize the other poster for what
he is, and understand that no matter how much proof he is presented
with, he will never admit that he is wrong.

Sad, but true. That is the reason he has no wife also.

But, as you posted, it is most certainly in the FARS that it is up
the the aircraft operator whether or not to allow scanners, even
Eric understand that now. Only one person refuses to believe
that, and there is no reason to argue the point with him.

John,

My dusty old Scanners Unlimited guide for the Bay Area shows the SB Cty Sheriff, Hollister and SJB Police Depts on 158.775 and 154.92, with secondary frequencies for Hollister of 151.025 and 157.75. The listings for Fire are 151.25 and 154.28 for CDF, and 155.805 for Hollister. The ambulance is on 463.00.

Cameron

Jason - You are incorrect on SEVERAL of your comments here.

First - I have never told a lie in my entire adult life.

Second - IF I were to say I had been wrong, then that statement would
indeed be wrong because it was NOT ME who was wrong. As I have
stated several times, the Captain of the flight crew is not going to allow
it
AND Eric Oyen mentioned the issue of the FAR's. Under US law, passengers
must obey the Captain of a vessel underway (either Air or Sea).

Third - I was basing part of my statement on Mr. Oyen's input since he
had responded to the question BEFORE me. Therefore,
he would be the one you should ask questions to.

Below is the message from Mr. Oyen, if you have an issue with this topic,
please pursue the matter with Mr. Oyen and NOT ME.

indeed be wrong because it was NOT ME who was wrong. As I have
stated several times, the Captain of the flight crew is not going to allow
it
AND Eric Oyen mentioned the issue of the FAR's. Under US law, passengers
must obey the Captain of a vessel underway (either Air or Sea).

Third - I was basing part of my statement on Mr. Oyen's input since he
had responded to the question BEFORE me. Therefore,
he would be the one you should ask questions to.

Below is the message from Mr. Oyen, if you have an issue with this topic,
please pursue the matter with Mr. Oyen and NOT ME.

2138. ICOM ICR3

Newsgroup: rec.radio.scanner
Date: 2000-11-07 00:00:00 UTC
From: Robin - VK2VN <parc@BigPond.com>
Message-ID: <MKSN5.25058$e5.47026@newsfeeds.bigpond.com>
Source record: 76398
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have previously owned several Uniden scanners.

Though my main use is for Aircraft band, the added TV
and MW (AM) band is very tempting.

I can get little information from Icom as to its scanning
features. I would like some information about the following...

Is the a "Priority" Channel function?

Is their a "Delay" function?

Is their a "Lockout" function?

Is their a "Keypad Lock" feature?

Is their a "Noise Blanker" function?

What is the amp hour rating of the Li-Ion
battery?

I note the radio has scanning steps of 5 or 6.25 KHz.
How does it work on the AM broadcast MF band, with the
9 or 10 KHz spacing?

Will the scanner work on the AM broadcast band with its
normal telescopic antenna?

What is the size of the speaker?

And finally, what is it like sensitivity wise on the Aircraft band
compared to other scanners?

This is my first use of newsgroups, so please forgive if
I have not "done the right thing"!

Kind regards,

Robin VK2VN (Sydney)

John,

If you go to http://home.bendcable.com/scanrite/scramble.html you can find .wav files of what the various kinds of scrambling sound like. From listening to the .wav samples I was quickly able to identify the signals I was interested in as "rolling code" speech inversion, which apparently is not decodable. From what I read, regular speech inversion is decodable (see CTP site), rolling code is not, and as the previous poster said, digital is definitely not.

Source record: 76409

Today is Election Day in the United States.

Our ability to listen can be lost if not protected by honest, informed representatives at all levels of government. ECPA and various subsequent attempts to legislate our scanning hobby out of existence originated in the House of Representatives. Most such initiatives have been stopped by the Senate. Be sure to reward your federal representatives appropriately if their seats are up for votes this year.

The next President could have the opportunity to sign or veto restrictive legislation. He will also be able to change the balance of opinion on the Supreme Court by appointing between two and four new justices. Some of our "rights" hang by the slender thread of 5-4 "split" opinions, and new justices are likely to be appointed who agree with the dissenters in some cases. (This does not pertain only to radio listening rights but to other important issues as well.)

Your state and local officials can impact your listening, too. They can pass anti-scanner-in-car ordinances, or regulate your radio towers within limits, or take other actions that can either enhance or impede your ability to enjoy your hobbies. They can also pass, repeal, or ignore so-called "sunshine laws" that promote public access to information about how the government is conducting business. City and county executives appoint law enforcement managers, and they will hire people who are likely to enforce their ideas about what citizens should and should not be allowed to do. Legislative councils make decisions about buying new or upgraded radio systems, including how much YOU are going to pay for them and whether or not they believe you should be able to listen in.

I will not attempt herein to summarize specific issues and players. As a member of an informed electorate, you should know these things about your politicians and candidates. Now is one major chance to have a say in how (and how openly) government business is going to be conducted over the next several years.

We who know even a little bit more than the average citizen about how public safety is protected in our communities have a responsibility to use that knowledge wisely. It is a good time to reflect on the fact that those agencies that we monitor every day do not exist solely for our entertainment. They perform vital functions in a free republic, such as providing safety and security to citizens.

Today, at your earliest convenience, get out and VOTE!

2150. Supreme Court to hear cellphone case

Newsgroup: rec.radio.scanner
Date: 2000-11-07 00:00:00 UTC
From: D Stark <dave@nf2g.com>
Message-ID: <6vVN5.162923$JS3.24625369@typhoon.nyroc.rr.com>
Source record: 76410

On December 5, 2000, the United States Supreme Court is scheduled to hear oral arguments in two cases that have been consolidated into one matter.

The cases are Bartnicki v. Vopper, 99-1687, and United States v. Vopper, 99-1728.

Here is a summary of the case history:

An unknown party placed an audio tape containing recorded cellular telephone conversations regarding ongoing, hostile negotiations between the Wyoming Valley West School District and the Teachers' Union into (co-defendant) Jack Yocum's mailbox. The conversation included comments by (plaintiff) Bartnicki that could easily be construed as threats to commit violence against school board members.

Yocum gave the tape to (co-defendant) "Fred Vopper" (real name Fred Williams, a radio personality) of WILK radio, and to (co-defendant) Rob Neyhard of WARM radio. Both stations aired the tape, as did some local television stations. Transcripts of the recording were published in some newspapers.

Bartnicki sued the above parties under both the Federal ECPA and the Pennsylvania Wiretapping and Electronic Surveillance Control Act. All parties moved for summary judgment, which motions were denied by the Federal District Court. The legal issues certified to the 3rd Circuit Court of Appeals were (as listed in the 3rd Circuit's decision, 98-7156):

"(1) whether the imposition of liability on the media Defendants under the [wiretapping statutes] solely for broadcasting the newsworthy tape on the Defendant Fred Williams' radio news/public affairs program, when the tape was illegally intercepted and recorded by unknown persons who were not agents of the Defendants, violates the First Amendment"

"(2) whether imposition of liability under the aforesaid [wiretapping statutes] on Defendant Jack Yocum solely for providing the anonymously intercepted and recorded tape to the media Defendants violates the First Amendment."

The 3rd Circuit answered both questions in the affirmative, remanding the case to District Court with instructions to grant defendants' motion for summary dismissal. One justice dissented due to disagreement with the court's analysis, but not the result (except that he expressed concern that Yocum was being given a "cloak" of First Amendment protection to which he might not be entitled).

The U.S. Supreme Court granted certiorari to answer the following question:

"Whether the imposition of civil liability under 18 U.S.C. 2511(1)(c) and (d) for using or disclosing the contents of illegally intercepted communications, where the defendant knows or has reason to know that the interception was unlawful but is not alleged to have participated in or encouraged it, violates the First Amendment to the United States Constitution."

It is important to note the fact pattern, especially as it differs from the McDermott case (extensively cited in the 3rd Circuit opinion) and from most Rapid Media issues:

1) The initial interception and recording of the cellular conversations was plainly illegal under Federal and state law.

2) The person committing the original interception was not a party to the case as he or she was unknown. In the McDermott case, the couple who provided the recording of Speaker Gingrich's cellular conversation were identified.

3) A bona fide news media organization (actually, several such organizations) made the content of the illegally intercepted conversation public.

4) Nobody connected to the media organizations had anything to do with the unlawful act of intercepting the cellular call.

Note also that the Supreme Court's formulation of the issue is broad enough to cover both questions raised in the court below. I expect a bifurcated ruling on this case - one part addressing the issue of First Amendment protection of the press, and the other part dealing with First Amendment protection of parties who provide illegally obtained information to the press.

For those of you who do not know, Michigan was trying
to make even hams get a special state license in order
to have ham gear.

Plymouth man wins fight for his HAM-radio rights
Volunteers critical in emergencies,many agree

By Sheri Hall / The Detroit News

LIVONIA -- Bill Johnston campaigned this fall for a civil right
that most people don't use: the right to communicate over a HAM radio.

The Plymouth resident monitors bad weather and disasters in his
spare time. He then relays the information to the National Weather
Service or police agencies with his HAM radio.

A bill proposed last month would have required radio-users that
pick up police frequencies -- including HAM radio owners -- to buy a
state-issued permit to carry the radio in a car, or face up to a year
in jail. HAM radio operators must already purchase a license from the
federal government.

"We're all volunteers, and some of us wouldn't be able to afford
another permit," Johnston said. "We feared that the pool of people who
help during an emergency would go down because they were afraid of the
penalties."

Johnston organized Livonia's Amateur Radio Club to lobby against
the law, and in the process won the praise of meteorologists and
emergency management officials who depend on volunteer communicators
in emergencies.

"I must have e-mailed 900 people in southeast Michigan about this
law," Johnston said.

The sponsor of the bill, State Rep. Mike Kowall, R-White Lake,
heard the radio-enthusiasts pleas and agreed to withdraw the bill.

"We wouldn't want to punish people who were obeying the law," he
said. "I'm trying to protect the police and the public, but I don't
want to curtail civil rights in the process."

Kowall said he wrote the bill to prevent criminals from using
radios to escape police.

"The Oakland County Sheriff's Department came to me because they've
been having a lot of problems," he said. "They'd respond to a breaking

and entering, and the perpetrators have been gone before they got there."

Now he's agreed to sit down with HAM radio operators to draft a new bill that punishes only criminals, and not all radio users.

"I think we'll elongate the sentence for anyone caught using a scanner while committing a crime," he said.

Meteorologists and emergency management officials praise Kowall for responding to the Livonia club's campaign. They say the radio volunteers are essential in situations that require a quick response.

"Spotters do quite a bit of public service," said meteorologist Darin Figurskey of the National Weather Service. "Without them, we're not going to know for real what's happening on the ground."

Radar tools identify storm systems, but do not tell meteorologists details about weather conditions, Figurskey said. So the National Weather Service uses the volunteer spotters to relay information to a key station in each county.

The county operators compile reports, then contact a volunteer radio operator at the National Weather Center in White Lake, who notifies the meteorologists of ground conditions.

"These first-hand reports allow us to clarify warnings, decrease the frequency of false alarms and describe storm damage," Figurskey said.

Besides reporting weather problems, HAM radio spotters help police departments communicate during disasters such as plane crashes.

The Livonia Amateur Radio Club is part of the city's emergency-management plan. Members attend training sessions with police officers and firefighters, and keep radio equipment in the basement of the police station for emergency situations.

"They're very active and dedicated to helping communities in a time of need," said Alden Sawyer, Livonia's director of emergency management.

He called in club members to staff police stations on New Year's Eve to monitor problems with the Y2K computer glitch.

Radio enthusiasts say they enjoy dedicating time to the public and helping out in a pinch.

"This is my way of giving back," Johnston said. "It's something I enjoy, and it's a benefit to society."

You can reach Sheri Hall at (734) 354-4047 or at shall@detnews.com.

Livonia Amateur Radio Club
What: An organization dedicated to improving emergency

communication.
Founded: In the 1970s.
Membership: About 45 HAM radio owners.
Meetings: Monthly get-togethers at the Livonia Civic Library to discuss radio issues, learn how to identify bad weather and plan for disaster response.
Public service: Volunteer on Livonia's emergency response team, identify weather conditions for the National Weather Service.

Saturday 4 November 2000

Police seize scanners tuned in to their pagers
Two city men face several charges after house search

Conal Mullen, Journal Staff Writer
The Edmonton Journal

City police looking for handguns Wednesday found computerized scanning equipment.

It was being used to monitor transmissions from electronic pagers, including those used by the police.

The discovery was made about 6:45 p.m. Wednesday when officers executed a search warrant at a house near 122nd Avenue and 127th Street, said Annette Bidniak, police information officer.

She said they seized a loaded .22-calibre handgun and a dismantled handgun.

She said investigators also seized what they believe to be a couple of grams of methamphetamine, or speed, $16,780 in cash, a Rolex watch and an old city police badge.

She said police also seized five computers with a total of 10 hard drives.

Bidniak said police noticed a program on one of the computer screens that appeared to be monitoring paging transmissions as they occurred.

The program was monitoring several pager frequencies, including those used by police, Bidniak said.

Peter Shokal, 56, of Edmonton, has been charged with possession of an illegal firearm, unsafe storage of ammunition, possessing the proceeds of crime, possession of a narcotic for the purpose of trafficking and two counts of possession of stolen property under $5,000.

Derek Nicolas Campbell, 26, of Edmonton, has been charged with possession of an illegal firearm and unsafe storage of a firearm.

Technology Advice You Can Trust

Today in News | The Week in News

Your Cell Phone Can Help Find You

Overseas, they're already implementing mobile tracking that will give you location-specific resources.

Rick Perera, IDG News Service
Thursday, November 02, 2000

Jaan Jagomagi sends a brief Short Message Service (SMS) on his mobile phone. A few seconds later, a map appears on the phone's display. It pinpoints his current location, in the center of the Estonian capital city, Tallinn. It's hard to make out details of the map on the small LCD display, but the point is clear: the wireless provider knows exactly where Jagomagi is.

"Location-based" services using that knowledge are on the way, whether you're in Estonia or your own backyard. Using your mobile phone, you'll be able to request lists of nearby hotels, restaurants, or service stations. And it doesn't matter where you are: the results automatically will be based on your current location.

Jagomagi's company, AS Regio, has developed software for this type of Mobile Positioning System (MPS) service. Together with mobile carrier AS Eesti Mobiiltelefon (Estonian Mobile Telephone, or EMT), Regio is launching in November what the companies say is the world's first such commercially available service.

Such capabilities are drawing greater interest as mobile phone and PDA functions blur. For example, service providers envision shooting you, a known aficionado of Chinese food, an e-mail alert via your mobile device letting you know about the highly-rated restaurant just a block away. Of course, the value of Global Positioning System (GPS) capabilities in map software is evident. (See "Map Your Palm for an Urban Safari" and "Palm Helps You Do New York.")

But Who's Watching You Move?
Other uses for the new MPS services include tracking a vehicle's location for fleet management, car anti-theft devices that can find a stolen vehicle, and a map plotter to help two mobile phone users find each other, Jagomagi says.

EMT development and technology director Tonu Grunberg says the company has contracted with the Estonian Rescue Board to pinpoint the location of mobile phone users who dial the 112 emergency number. Estonia is the first country to implement such a technology, he says.

"The accuracy is not very good in rural areas -- 300 to 500 meters -- but in city areas it's quite exact because there are so many base stations," he says.

The technology also has potential uses for law enforcement. Already, Estonian officials have used MPS to locate criminal suspects, says Linnar Viik, IT adviser to the country's prime minister.

"We have had a couple of cases of criminal investigations where a court has admitted it [as evidence] for tracking a mobile phone," Viik says. "In one gun-trading case, a person was located in [the city of] Tartu because he made a mobile call."

Asked if such tracking technology raises potential human rights concerns, Viik says legal safeguards are in place to prevent its abuse. "Not the police, not even the secret service have the right to track. They have to go to a court to get a one-time permission to go to the telephone company" and request location data.

Grunberg also says his company has implemented strict security measures, similar to those in place for online banking. "Only people who want to can be tracked. It's up to each person to decide," he says. That's an issue that's quickly moving from theory to reality for users of mobile devices. (See "Service Offers to Beam Coupons to Your PDA.")

Its called DVP (digital voice protection). Thousands of codes keeps it one of the best and widely used methods. Very hard to get around and very easy to change if they suspect someone's listening.

Greetings,

I have for sale a Keltron Amplified speaker. These work great for improving the sound of portable scanners or other small radios. It has volume and tone adjustments. It can be powered by 4 C batteries or has a jack for a 9vdc adapter. There are jacks for "mic" or and "aux". I will include for free a mono plug cable for connecting to the speaker. The speaker works and looks great. The speaker grill looks new. There are some very faint scratches on the cabinet from normal use, but never abused. Original owner, non-smoker. I paid $30 + tax new. I am asking $15 + $3 for shipping. I will securely pack and ship within 24 hours of receiving payment. Please pay with money order or cashiers check. Feel free to check my ebay feedback rating under "tr2001". I have a picture of the speaker posted at:

http://www.optima-optics.com/images/speaker.jpg

Please email me if you have anyquestions at:

w7trx@my-deja.com

Thanks for your interest. TR

While I'm not totally enchanted with being an American, I'll just point out that our government, as high-handed as it seems soemtimes, isn't as intrusive as socialist governments like Canada's.

Canadians are, by and large, fine people. But just ask any of them how much they love their government, and you'll get an earfull!

By all accounts, these two guys were a couple of dopers.
They got hauled in on dope and weapons charges. What kinda
reverse-bleeding-heart would chastise *any* police force for
dragging this kinda phucking scum off to the hoosegow, eh?

```
:...But NO communications or radio violations, and nothing among the charges
:that would apply to that. Makes one wonder why this is here on an amateur
:radio newsgroup (1 of 5 cross-posted groups).....
:

Because that was the Headline from the article in the paper.
Radios are becoming as feared as guns. Watch for a ban
on scanners and ham gear. Activities like this will be used
to justify it.

See Strong Signals web page. That is where I saw this.

:> Police seize scanners tuned in to their pagers
:> Two city men face several charges after house search
:>
:>
:> Conal Mullen, Journal Staff Writer
:> The Edmonton Journal
:>
:>
:> City police looking for handguns Wednesday found computerized scanning
:> equipment.
:>
:> It was being used to monitor transmissions from electronic pagers,
:> including those used by the police.
:>
:> The discovery was made about 6:45 p.m. Wednesday when officers
:> executed a search warrant at a house near 122nd Avenue and 127th
:> Street, said Annette Bidniak, police information officer.
:>
:> She said they seized a loaded .22-calibre handgun and a dismantled
:> handgun.
:>
:> She said investigators also seized what they believe to be a couple of
:> grams of methamphetamine, or speed, $16,780 in cash, a Rolex watch and
:> an old city police badge.
:>
:> She said police also seized five computers with a total of 10 hard
:> drives.
:>
:> Bidniak said police noticed a program on one of the computer screens
```

:> that appeared to be monitoring paging transmissions as they occurred.
:>
:> The program was monitoring several pager frequencies, including those
:> used by police, Bidniak said.
:>
:> Peter Shokal, 56, of Edmonton, has been charged with possession of an
:> illegal firearm, unsafe storage of ammunition, possessing the proceeds
:> of crime, possession of a narcotic for the purpose of trafficking and

Canada has certainly not outlawed guns. We just have to register them before 2003. However, this whole "gun registration" thing is ridiculous. Think of it. How many criminals are going to register their black-market guns??? The law was passed to appease the ignorant city-folk who know nothing about guns.

WOW! you actually know where Edmonton is!!! lol.....that's more than the average American knows ;-). If you guys only knew how you are the butt of Canadian television's jokes..... Why don't you ask the Governor of Arkansas who King Sven is.....haha - this is too easy. If any of you has a satellite dish and can get CBC, check out "This Hour Has 22 Minutes", it's loaded with funny political pranks against you guys. It's amazing how little your "educated" politicians know about Canada. Why should you care? You don't have to care. Because contrary to popular belief, Canadians do have internet access in their igloos. We have what they call a frozen-optic cable network that was laid by a team of dogsleds in -45 degree weather. And have you guys heard about the new MMX processors??? They're amazing! Have they released them in the US yet? hahah...you Americans (well, most of you) need to wake up and realize that you're not the only humans in North America, and that your beer is like water!!

Adam Kolari
Sudbury, Ontario

P.S. - Wondering how I know so much about American ignorance? My sister lives in Kansas (they crave Canadian nurses down there) and she tells me stories all the time! ;-)

> Edmonton is in Alberta CANADA. Tell me why I care.

If you are in the Washington County area of Oregon, point your browsers
to:

http://www.live365.com/cgi-bin/directory.cgi?autostart=witchdr

I currently patch in Washington County talkgroups related to South
Cities only. This includes
Tigard, Tualatin, King City, Sherwood, TVFR (Countywide). I also patch
in OSP, Lake
Oswego/West Linn F-1/2. I donï¿½t do the rest of Washington County because
itï¿½s just too busy. I do
have Public Safety common(PS1/PS2) plugged in so you may hear other
units.

Jason - You are incorrect on SEVERAL of your comments here.

First - I have never told a lie in my entire adult life.

Second - IF I were to say I had been wrong, then that statement would
indeed be wrong because it was NOT ME who was wrong. As I have
stated several times, the Captain of the flight crew is not going to allow
it
AND Eric Oyen mentioned the issue of the FAR's. Under US law, passengers
must obey the Captain of a vessel underway (either Air or Sea).

Third - I was basing part of my statement on Mr. Oyen's input since he
had responded to the question BEFORE me. Therefore,
he would be the one you should ask questions to.

Below is the message from Mr. Oyen, if you have an issue with this topic,
please pursue the matter with Mr. Oyen and NOT ME.

I have a super clean BC2500XLT 400channel handheld scanner (modifiable from what I am told but not done) Date code OGID. Case is included and battery life is excellent with the supplied Nicad and wall wart charger, no manual but programs like your typical Rat Shack scanner.. Looking for a repairable HF rig in trade, Repairable HF amp, or something interesting (vhf/uhf) Ham stuff etc.. Or if all else fails, make me an offer.. I have Jpegs of this scanner for your viewing pleasure, please email..
Tnx Richy

John,
why are you continuing to involve me in your
"petty bickering"?

The law is clearly stated and available through a lookup of US Code.

It has been quoted in here on more than one occassion.

now, cease ionvolving me in your petty squabble and get to the point.

2198. FS Radio Shack PRO-43 with full cellular receive.

Newsgroup: rec.radio.scanner
Date: 2000-11-07 03:12:42 UTC
From: VE2CJW <morinm@csdgs.qc.ca>
Message-ID: <8u7rv6$gn6$1@nnrp1.deja.com>
Source record: 76491

I have a very good condition Realistic PRO-43 that covers the following
bands:
30-54 mhz
118-174 mhz including AM aviation band.
220-512 mhz including military aircraft band.
806-999.9875 mhz with full cellular band receive.

Comes with instruction manual and original box. Asking $175. U.S.
shipping included. I can't send COD to the U.S. because of postal
regulations and PayPal is not international but other arrangements can
be made. I have done this lots of times before without any problem and
can give references in the U.S. and Canada.

Inquire by email if interested.

Source record: 76397

The only asvice I would give is :
1) Get a handheld,for obvious reasons-unless you happen to live next to a major military instalation and/or a racetrack.
2)Make sure the hand held that you get is capable of recieving the military air band (225mhz to 400mhz,in am),unless of course military aviation does not interest you.
Alot of the cheaper scanners omit this band in its entirty.
As far as nascar gos,I would imagine that just about any scanner would do for that.

Why don't you let the CANADIANS worry about what their civil liberties entail and how their laws are enforced in Canada; and confine your worries to domestic U.S. legal issues. They don't have to follow your ideas of what our Fourth Amendment provides. I'd ask that they do the same where a search and seizure issue in the U.S. were concerned.

Particularly since there are a number of radio receivers that Canadians
can buy new that would be illegal in the USA, while I don't know of any
receivers that are legal in the USA but not Canada. Just who has the
more restrictive laws?

I don't know how this applies to that type of situation (or even if the law is similar there) but in order for a sign (say a stop sign) on private property in my old hometown to be legally enforceable it must have a city decal on it. Not sure about the process to get said decal, but there was a mechanism and some sort of legal precedent in place.

Perhaps that's true on average. On the other hand, Canada doesn't
have any laws making it illegal to sell radios that happen to be able
to listen to certain frequencies in the 800 to 900 MHz band. (See - this
article *does* have something to do with radio).

>Canadians are, by and large, fine people. But just ask any of them how
>much they love their government, and you'll get an earfull!

That's certainly true. And, from what I read on Usenet at least,
you'd get about the same response from most Americans about their
government. At least Canadians have more political parties to
complain about.

It makes much more sense for the police to switch to encrypted communications, or at least something more difficult to receive than FM voice and standard pager data protocols. And, in fact, that seems to be happening.

I did a side by side test and the 245 far out performed the 92B. Lots
of missed calls on the 92B that the 245 did not miss.

If I'm not mistaken (I might be), I believe that this was tried in one of the western states (Arizona?) a decade or two ago. The idea didn't fly with officials who declared that state speed limit laws applied to this private road as well, since it was for public transit and not for sport (race car) purposes. I vaguely recall this, can anybody verify?

Driving is a priv in New Jersey, because the state owns all the roads.
If you had your own private road, then you wouldn;t need a license either.
Now, if enough people chipped in and built their own private road... a sort of cooperative or private turnpike..
Hmmmm

You're not getting the gist of my post. It's not the fact the we have to register our guns, but the reasons why. And it costs us money to register our guns. We already had laws in place where, each time you bought a gun, it would get registered on your FAC (Firearms Acquisition Certificate). So the only reason for this new gun registration program (which the gov't has already gone way over budget 1/4 way into it) is to make the average Joe Blow think that the streets will be safer because the gov't now has a watch over all the guns in the country. This couldn't possibly be farther from the truth, because it is only law-abiding citizens (e.g. hunters and outdoorsmen) that will register their guns. Summed up, it's a big waste of our tax dollars.

Now that all (?) the cell phones have migrated to 800 MHz (in the US), perhaps there's room for public safety radio systems back in the 400 MHz area. Why don't they look into 400 MHz trunked systems?

Well, in fact, there *are* short-range RF data link chipsets that use
on-off keying of a carrier (CW) to transmit information. Of course,
they send binary data streams, not Morse code - much more efficient.

Yes I agree that America is great in many ways. You have the greatest military power, the greatest athletes (mostly due to your population), a great currency, among other things. And yes I agree we should break all ties with the Queen. However, about 50% (I'm being generous) of all Americans are ignorant, arrogant pricks, which isn't too hard to pick up by reading your post. Your lack of knowledge about anything non-American makes you look like very simple minded individuals. We take American History in high school (not mandatory, but lots of kids take it anyway). Why? Because we realize that there are other people that live around us and that we should get to know them. Do American children take Canadian history? I highly doubt it. America has the potential to become by far the greatest nation, but it will never realize that potential due it being overly cocky, arrogant, self-centered and hot-headed, among many other things. Sorry if I offended anybody with this post, but it's how I feel about the subject.

Adam Kolari

The US Government is using 400 mhz trunked systems....

In this part of RI, most local agencies use the 150-160mhz band...
unbelievable, eh?

The only advantage is that most agencies can talk to each other because they
all use the radios with the same frequency ranges, so other departments can be
easily programed.

Just heard the Russian language transmissions from the Intl Space Station on 143.65mhz here in Kansas City MO around 1430L (11-8-00) and for about 12 minutes.

Anyone know who the cosmonauts are in comms with on this freq?. Vertex VX-150 rig with rubber ducky. Absolutely nothing special, just left the rig on that freq for the afternoon while working around the house and the broadcasts came up after a couple of squelch breaks. Neat.

I came across a good deal on a 2006 and 2042. So I am selling this
perfect scanner. Will be selling the 2042 for a great price shortly. And
your point is????

I think the cops should be glad to know that they have a "regular
audience"
around here scaaners are fairly popular ,and its a good way to get to
know what is going on it town.

We have sunk to a new low in the USA if they are afraid of us
listeneing in.
Actually, it really promotes public respect for the cops when one comes
to learn
of all the crap, and baby-sittting, and stupidness they have to put up
with each day.

Domestics, speeders, baggy pants- earing kids dealing drugs, nut cases,
escapees, people driving off
without paying for gas, cows on the loose in the road, neighboors having
conflict, etc
Same sh_t each day. Weekends are the real fun times, especially when
some unprononuncable
gets pulled over with an international driver license!

Driving is a priv in New Jersey, because the state owns all the roads.
If you had your own private road, then you wouldn;t need a license
either.

Now, if enough people chipped in and built their own private road... a
sort of cooperative or private turnpike..
Hmmmm

From: Mike Mayer <mayermh@ix.netcom.com>
Message-ID: <8ufocpvjn1@nntp9.atl.mindspring.net>
Source record: 76200

Metro Life Flight is simplex. Not trunked, luckily. 155.385. One of the more interesting frequencies on my scanner. Both pilots and med crews use the freq to talk to FCO (Flight Control Operations) up at Metro General Hospital. Yes, you'll hear takeoff and landing. However they come and go so quickly, you almost have to be driving in the area to catch them. When they take off, you'll hear the pilots announce that to FCO, however they are already in the air by the time they do. You have a better chance when landing, since sometimes you can hear them talking about taking off from their current location, inbound to the Canton base in which case you can usually get there if you happen to be out driving around nearby.

You can usually also hear them shout out the frequency for the fire department they are going to land near, and you can sometimes dial THAT frequency in quickly enough that you can hear Life Flight communicate with the FD at the accident scene as the helicopter talks to them about an LZ (landing zone).

More interesting than the actual takeoffs and landings are the medical reports they give over the readio as they leave the scene of an accident or whatever, inbound to the hospital. Frightful stuff sometimes. Many times you'll hear them giving a live report of a nasty accident victim, and then see it in the paper the next day or on the TV news later.

I suppose you could also dial-in the UNICOM air frequency, which the pilots would use to communicate with other aircraft (is it the CAK airport freqs? I don't know). But pound for pound you'll like the 155.385 much better.

Currently there are Life Flight bases in Lodi, Metro (downtown Cleveland), Solon (where we live), and the newest in Canton. They usually refuel and have maintenance done at Burke Lakefront, sometimes Cuy. Cty. Airport. For the Canton ship, they might very well use CAK cuz it's closer.

If interested, I have a bit of a blurb on Life Flight, on my web page -http://pweb.netcom.com/~mayermh/documents/eggshells.html

Sorry I don't have the Canton trunked for you. I think Police Call at Radio Scrap does.

Actually, unless it has changed in the last ten years or so, Int. Driver's Licenses are not valid (at least in Okla., where I live) I am a former police/911 dispatcher and at the time I was on the job, IDLs were not acceptable. The driver's home country OLN was (usually) acceptable, but a IDL by itself would result in a ticket and possible vehicle impound. This is a university town, and we saw a lot of foreign licenses, so each officer and dispatcher had a list of acceptable/not-acceptable licenses. The so-called "International" Driver's Licenses are generally accepted in Europe and (maybe) South America, to the best of my knowledge (which, I admit, may be out of date).

The doppler shift due to the speed difference between zero
and the velocity of a craft in orbit is infinatesimal.
Remember, it's the speed of light that is involved, not sound.

It is only useful to listen when the station is both above your horizon and
visible to one of the wellknown groundstations. When it isn't, it simply
won't transmit.

I can hear the station before it becomes visible to the Soviet stations,
and I can hear them switch on right at the moment when the groundstation
knows (from their orbit calculations) they become in range, and call them.

Greg,

Rich Have early EU version...
Right now there is dealy in Yaesu's delivery cause they are making some
fixes to couple bug's (that rich mentioned hiss ect) but its currently
available in small qty's.

My unit is earliest production run...
I sure like that radio, unfortunately that radio is not in my hands
right now....

That hiss is not inferering me cause i sure can mod it away.
But one thing i wonder, why they select that PL-259 connector to it??
Even AR-8600 have better connecot (BNC) but aor is not good receiver as
VR-5000 is overall...
Specially HF suck's in AOR! :(
Too small VFO knob is really irrating in AOR.
Its basicly similar to use as AR-8200 is...

But i miss my VR-5000.

Regards
Mika

They are in contact with Russian ground control. The Russians are
running this part of the mission currently. I don't speak Russian but
it's still a thrill listening to signals from space! Man I LOVE this
stuff!

I completely agree and I don't even own a gun or want one. The U.S.
has all these guns laws and making 1,000 more gun laws will not do a
thing to reduce gun crimes. Anyone who believes otherwise hasn't a
single clue in their head.

Look, criminals don't get their guns legally. You think honest Joe
Smith the homeowner is going to do a background check on John Doe to
make sure he's legit before selling him a gun?

> There's also the issue of those
>otherwise law abiding citizens with guns who don't properly
>secure their weapons so that their children get hold of them.

That's right and it's up to them to educate their children about
guns and their safety.

>Perhaps registration brings with it better awareness of
>regulations and safety?

It hasn't worked before, it's not working now and it won't work in
the future. EDUCATE THE CHILDREN and KEEP THE GUNS LOCKED UP WHERE
THEY CAN'T GET AT THEM. Laws are not designed for criminals, we call
them criminals for a reason....

It's doppler shift. At the start of a pass start 5Khz up from
143.625 (143.630), at mid pass be on .625 and a few minutes later go
to .620. When they start using the ham gear you have to do the same
thing on RECIEVE only.

Here in Shrewsbury, MA, I am getting tons of skip in my car (granted I am using an antenna tuned to 42MHz).
Anyone know where the following are coming from? These are the only ones I am not sure of:

29.64 sounds like ham, an American talking to an Australian BUT they mentioned going to 21.195MHz which I don't think is a ham freq

30.96 Spanish speaking

31.155 Spanish

33.375 Spanish

33.425 Spanish

35.075 Spanish-- nothing but numbers, either all I heard was the base station, this is a simplex, or this is a clandestine "numbers" station

35.48 two gentlemen w/southern accents, not very clear

43.82 two-way comms, mobile units barely audible

Sent via Deja.com http://www.deja.com/
Before you buy.

29.640 is a 10 meter amateur repeater freq. 21.195 is a 15 meter CW/digital
freq.

Whenever conditions open up, I usually hear a lot of paging signals on
30.020 and 30.220 from Canada. On 30.220 I also hear some Spanish language
comms.

Charles,
I have the R3 and am very happy with it. I have some 900 mhz video transmitters that I connect to my TV and watch TV all over the house and yard. It works great. The only complaint I have is how ICOM nickels and dimes you on the accessories. The Radio seems to perform well and so far I have not had an intermod problem. Its a cool toy and if I could have wished for anything added I would have liked SSB support but you cant have everything in such a small package.
By the way, you can use alternative power supplies and they work well. You are not stuck with the ICOM P/S as the voltages and power requirements are clearly marked in the operations book that comes with it. Check out www.egroups for a really good group on the ICOM. Good luck, Jeff

Again, I don't hate Americans. I just think that they need to change certain aspects about them. And I'm not being biased, because I know we Canadians have negatives also. Regarding hockey, I doubt that women's b-ball takes in more cash. My point was that you guys borrowed our game, and are making money off of it, just like we have done to you guys with baseball (not sure if there is profit, though), although we only have two teams. And speaking of basketball, Dr. James Naismith, a Canadian, invented the game.

2291. BLM frequencies?

Newsgroup: rec.radio.scanner
Date: 2000-11-09 00:00:00 UTC
From: Steve <steve@pactitle.com>
Message-ID: <3A0B1AB8.AA1855A9@pactitle.com>
Source record: 76340

I'm looking for frequencies used buy the BLM around the Imperial Sand Dunes Recreation
area (Glamis Dunes) near the California/ Mexico border. One of the rangers I spoke with
recently mentioned they now used a trunked system.

I spend a lot of time out there in the winter months and there is always ranger, police and medical
activity. Thought it might be fun to listen in.

Adjacent cities to the area would be Yuma, AZ and Brawley, CA. I think Brawley is located in
Imperial county.

Thanks,

Steve.

> are they all worthless?

I don't know about the Pro-79, but I recently purchased a used Pro-94 with the same problem. I've never seen such horrible selectivity on a triple conversion scanner! While reception is occasionally clear, generally it's noisy and occasionally I get 2m ham repeaters bleeding in from 10 MHz away on VHF-Hi band. The 2m repeater is about 30 miles away and doesn't interfere with VHF-Hi on any of my other radio gear (including older dual conversion units). The Pro-94 doesn't seem to work any better on 800 MHz trunking.

Does this sound normal? I was thinking that the radio was defective and that I would send it back to RS for repair, but I'd hate to throw good money after bad.

Dear Steve & alia,

If officers used high tech radio sets, is their onto some danger that they would argue that they were too complicated for normal use, except where encrypted traffic is needed to deal with using high tech radios. Also, what would the overall cosst of taxpayers money to establish a new network of high tech radios & support network of repeaters & operators such as dispatchers to ensure that communication were effective for users concerned.

Yours,

Jim.

Some law enforcement agencies welcome the scanner listener's into their corner. But in some areas, the scanner listerners are treated worse than the common criminal.
Most of this anti-scanner garbage was started by the Cellular Phone Industry in the mid-1980's.

I think the cops should be glad to know that they have a "regular audience" around here scaaners are fairly popular ,and its a good way to get to know what is going on it town.
We have sunk to a new low in the USA if they are afraid of us listeneing in.
Actually, it really promotes public respect for the cops when one comes to learn
of all the crap, and baby-sittting, and stupidness they have to put up with each day.
Domestics, speeders, baggy pants- earing kids dealing drugs, nut cases, escapees, people driving off
without paying for gas, cows on the loose in the road, neighboors having conflict, etc
Same sh_t each day. Weekends are the real fun times, especially when some unprononuncable
gets pulled over with an international driver license!

No law says you can't have your own road and charge for the use of it.

In Lexington Ky, or so the story goes, years ago Lane Allen Road was a
privite toll road.
Owned and operated by MR Allen. One fine day he jacked his rates, and
community was going to hang (as by the neck until dead) him, but where
convinced to let him leave town and never return.
Private Roads do exits. There is a "private" turnpike up in main. Of course
the police still patrol and give tickets. Been there, done that, and have the
reciept as a reminder. But, unlike most tickets, it did not cause my insurance
rates to go up.

>Good Article...unfortunately, there are no 400 mhz frequencies in major metropolitan areas
>in the US, especially in the quantities needed for a trunked system.

Actually, most of the phones in the US are also around 1.8 GHz, in addition to 800 MHz. There are some old IMTS channels available in certain markets on UHF-T band frequencies (470 - 512), but nearly all of these died in the mid-80's. There were NEVER that many frequencies available there, anyway! I knew a man who built such a system as part of his RCC paging operation in the late 70's in and around New York City. There were four channels per site using Micor vintage fixed-end and mobile equipment. Imagine waiting for an open channel there! Most of these frequencies *are* being reassigned as the FCC migrates toward placing full-power, but narrow-banded users in between wide band channels. In 2005, EVERYONE who has not voluntarilly narrowbanded will become a "secondary user" and will be responsible for the prevention of interference to narrow band stations as we shoehorn other users in between us.

There are MANY UHF trunked systems in the US. New Jersey (where I came from originally) exhausted the NPSPAC 800 MHz channels almost immediately because of several very large statewide systems. The APCO frequency advisor at the time had applied to the FCC to issue waivers for extending TV Channel 19 northward for public safety use. Today, most of NJ has 500 MHz frequencies available on a more or less exclusive basis and Channel 20 for southern NJ and Philadelphia. New York City and Long Island picked up Channel 16 for public safety use (along with 14 and 15 which have been available since the 70's).

Amongst the many APCO 16 compliant UHF trunked users are: Piscataway, NJ (500 MHz), New York City (483 MHz), Ocean County, NJ (506 MHz), the Department of Defense Base Support Trunked Radio System (406 - 420 MHz).

There are even more LTR, SmarTrunk or MPT (non APCO 16 compliant) UHF commercial systems. Yes, trunking abounds in UHF. Just not everywhere.

Trunking even works for VHF. The State of Wisconsin is prototyping a VHF trunked simulcast system on Department of Defense (138 - 144 MHz)

channels.

Now, most areas have exhausted UHF frequencies. There are only a handful of frequencies for public safety in the 453/ 458 and 460/ 465 range. Many places use the interstitial frequencies for fixed operation links, making shared use in a metropolitan area impossible. The FCC has hampered this effort by allowing digital TV to construct HDTV systems in metropolitan areas without protecting the "T-Band" channels. Here, in St. Louis, we cannot get a T-Band channel because of this. The only hope of using UHF is interservice sharing and stealing from another service who hasn't loaded up their pool of frequencies. Refarming kind of did this by establishing two pools, one for public safety and the other for industry.

That leaves 700 MHz (which may or may not come to fruition in many areas) and 220 MHz with hybrid QAM or compandored sideband modulation (still an underutilized band in many parts of the country).

RF communications is not something that lends well to broad generalizations.

Perhaps registration makes it difficult for criminals to buy guns
through legal channels or from other citizens who have bought
them through legal channels? There's also the issue of those
otherwise law abiding citizens with guns who don't properly
secure their weapons so that their children get hold of them.
Perhaps registration brings with it better awareness of
regulations and safety?

The communication is fullduplex, the groundstation is on another frequency.
So even when you are close to it, you won't hear it when you are on
143.625. What you are hearing is the audio feedback.

You now own a classic scanner. Keep it, and save up for a good portable trunking scanner so you can take the action with you anywhere. Trunking scanners are worthwhile so far, but you might wait a little to see if a trunking scanner with digital scanning capabilities will become legal and available soon.

Look for a Uniden BC895XLT base or an Icom R2 portable. They will
both fill your needs for OPP monitoring. The cell frequencies are covered by
the Canadian or Export version of the IC R2, as well as the OPP CTCSS
tone-board monitoring which is built-in. The earlier versions of the BC895
Uniden Base unit was modifiable for cell phone monitoring and a CTCSS tone
board was available as an addition for the then new OPP communication
system.

Dayton, Ohio Hamvention had a working prototype this past May/2000.
I saw and heard it in operation. I wasn't able to get close enough to
severely interrogate the people showing it off because the place was packed
and I only had six hours to search out what I went for. BC780XLT was only a
curiousity to me then, but talk of digital capabilities has me looking over
my shoulder now. Maybe it's just hype, but I'll keep looking even though I
already have six scanners with little time to use them lately because I'm
too busy trying to afford the next one. If my wife has her way, she'll force
me to provide for the family first. Imagine that!

Most of today's Cell Phones are rebroadcast on cell towers in the 870 to
894.5 Mhz range, roughly, using a Narrow FM format. If your scanner isn't
capable of monitoring these frequencies, it's because they've been outlawed
in the US. You'll have to smuggle in an export type from Canada:-):-):-)
Jack
PS: Some scanners will overhear the odd cell phone conversations on an IF
image frequency. The lousier the scanner, the more cell conversations you
will hear, but they will interfere with or overlap other services which are
on the actual frequencies the scanner is monitoring.

You can use an outdoor antenna to increase range, but you'll interfere
with neighbours, and they will hear your conversations from further away.
That might not become a problem if your in the Catskills. Rip Van Winkle
would have liked one of those:-):-):-):-)

I'd just start tuning around the amateur bands. You're bound to hear
communications on the various bands any time of the day or night. Just
remember, for SSB below 10 MHZ, use LSB; above 10 MHZ use USB. Tuning
around the voice frequencies will get results.

It doesn't matter what kind of new hi-tech radios they get.... they will still bitch and complain in a few years because they are outdated (as newer one come out). It is almost impossible to stay on top with the latest technology unless you have a unlimited source to the taxpayers money like the NSA, FBI, DEA and SS.

Local government has to go through the channels to spend the $$$$.
Before long you will never again hear your big city local police on a scanner. Every big city will soon be able to afford digital radios that with the touch of a button can change binary codes and even IF the FCC allows digital scanners to be produced AND sold in the good ole US of A, you won't be able to keep up with the codes to monitor them.

The smaller town are still looking at smaller funds....so they won't be able to go digital for another 5 to 10 years so people like me are OK for now. I do feel sorry for all you big city scanner nuts! My local police uses 460.025 and voice inversion :-)

I really believe that a police agency that wants to hide every transmission from us is going to become the secrete police! LET THE PUBLIC MONITOR all conversations except very important stuff like deaths (names) from car wrecks, drug busts, and vital private information. What does it hurt for use to hear traffic stops, general dispute calls, fire calls, ambulance calls and donut breaks??????? What the heck do they have to hide? Use DVP for the private stuff and keep everything else in the clear!

Just one scanner nuts opinion!
Take it or leave it.

:>Because that was the Headline from the article in the paper.
:>Radios are becoming as feared as guns. Watch for a ban
:>on scanners and ham gear. Activities like this will be used
:>to justify it.
:
:It makes much more sense for the police to switch to encrypted
:communications, or at least something more difficult to receive than
:FM voice and standard pager data protocols. And, in fact, that seems
:to be happening.

Actually that has led to a court fight in Florida. The cops did
encrypt their voice traffic. Now everyone is afraid that the cops
are hiding abusive activities. As it was, Bill Check was able to
show that the NYPD MDTs were being used to tell dirty jokes
and make racist comments about suspects.

I would expect that the police will be forced by the courts to
only encrypt with a court order (court supervision, and only
for a limited time) as it is now done with search warrants and
wire taps.

2336. Sun Editorial: The secret police

Many departments are wanting to go to encrypted
communications once they have a digital system.
The problem, as this editorial points out, is that the
press, and the public, looks at this type of security
as if the police and government agencies are trying
to hide something.

Already there are officers, as a senior Ind. State
Police Sargent pointed out to me, who are using
out of band CBs to tell dirty jokes, get their stories
straight and other less than professional activities.
IPD has a "small" problem with these types of activities.
With encrypted trunking it would be possible for officers
to have a commo tech create a "private" talk group
that the bosses, the media and others would not be
able to intercept. An example of this happened in the
NYPD were a scanner hobbyist was able to read the
Mobile Data Terminals (MDTs) of the police and found
many officers sending sexual jokes and racist comments
between themselves.

The other problem is that officers use low cost scanners
to track talk groups that they are not assigned, often in
adjacent patrol areas or even other departments. An
example was a Marion Co. deputy who transported
prisoners who was not given the talk groups for the
bailiffs at the courts or IPD downtown. If he had an
escaped prisoner, he had to coordinate via dispatch plus
he could not hear the other agencies without a scanner.
In my county, the ambulance service will
not let the fire fighters on their talk group which makes
it hard for them to talk the ambulance crew into the
accident scene Encryption would make any interagency
monitoring impossible.

My guess is that in time the police will have to go to
the courts to justify encryption just as they now do
search warrants and phone taps.

Sunday, October 29, 2000

Sun Editorial: The secret police

The taxpayers have shelled out millions of dollars for a new, state-of-the-art digital emergency dispatch system for police, fire-rescue and other public safety agencies in Alachua County. And now that they have it, the bureaucrats who run the system intend to lock the public out.

The message that the Radio Management Board sent this week in refusing to allow the news media access to its encrypted system was simply this: Taxpayers, mind your own business. If we think there's something you ought to know about what we're doing, we'll send a press release.

That's not acceptable. Police officers and fire and rescue worker are just about the only public employees who literally have the power to make instant life or death decisions. News reporters have always been able to scan police and fire frequencies to find out when emergencies - a bank robbery, a fire, traffic pileups - occur. It is the job of reporters to pass on what they learn to their readers, listeners and viewers; to the public, to the taxpayers.

And although police and fire fighters might not always welcome the media's presence on the scene, the "watchdog" function reporters perform does nonetheless help to maintain public confidence in the professionalism of law enforcement and fire and rescue agencies. (To their credit, both Sheriff Steve Oelrich and GPD Chief Norman Botsford support continued public access to emergency dispatch.)

Will public confidence long hold now that the system has gone undercover? With official silence, will there inevitably come the temptation to cover up acts of incompetence at the scene of a disaster, or police misconduct? Can taxpayers continue to trust their public safety employees to make life and death decisions when technology turns the police force into secret police?

We think the Radio Management Board has made a terrible error of judgment in deciding to lock the people out of the public's business. We trust Gainesville and Alachua County commissioners will quickly intervene on behalf of their constituents; and on behalf of open government.

While this has to do with LAPD,
the same problems will show up
here in Indiana, and even overseas.

Police Say Radios Too Low-Tech
By JACK LEONARD, Times Staff Writer

But that was before sprawling office towers and parking structures started blocking radio waves. And before wireless phones--with their crystal clear reception--upped expectations for two-way communication, while at the same time stealing frequencies from radio users.

Now, it seems, in this era of technological innovation, the crackling police radio is starting to show its age.

Police and fire agencies across the country are using antiquated equipment developed in the 1950s and '60s that has failed in major emergencies, including the 1992 Los Angeles riots and 1993 Laguna Beach firestorm.

That problem is prompting departments to spend hundreds of millions on cutting-edge radio networks, only to encounter many new--and sometimes dangerous--breakdowns.

In one extreme case in Atlanta, a new police radio network failed to pick up an officer's call for help just moments before a rifle-wielding suspect wounded her and killed her partner. In Delaware, firefighters resorted to shouting out of windows because their $50-million communications system didn't work inside high-rise buildings.

In Los Angeles, police use a 21-year-old network so out of date that manufacturers have stopped making parts for it. For years, cash-strapped technicians had to cannibalize parts from some hand-held radios to fix others. The problems reached a crisis during the 1992 riots, when officers in the field faced a critical shortage of portable radios.

The city is installing a new system.

Orange County began rolling out an $80-million network earlier this year and experienced its own static--including several incidents

that police insist put their safety at risk. This summer, Irvine officers complained that new radios failed to pick up critical information from dispatchers during an office building search for a murder suspect.

"I think we've gone backward instead of forward," said Irvine Police Officer Jeff van der Sluys Veer. Some of his colleagues now rely on their own cellular phones and pagers, he said, "anything they can to maintain communications."

The problem is part physics and part finances.

The design of police radio systems makes it difficult for signals to penetrate the heavy steel and concrete of office buildings, parking garages, shopping malls and even hospitals. As these structures sprout, they present major obstacles for officers trying to keep in touch with each other.

Wireless phones also operate with radio waves, but engineering experts say they often provide far better service than police radios because the telephone companies place more radio towers in highly developed areas. Local governments simply don't have the money to match that kind of coverage--even with state-of-the-art systems.

The problems are being closely watched in cities across the nation. The Los Angeles County Sheriff's Department, which also is building a new radio system, has hired a consulting firm to study the problems elsewhere and make recommendations.

The quality of radio service varies greatly--even among agencies purchasing the same type of advanced systems. San Diego's new network is similar to Orange County's, but officials there said they've experienced few problems and are generally happy with it.

In dozens of cities, however, police and fire officials have faced signal failures in patrol areas and inside malls, hospitals and even their headquarters. In many cases, the breakdowns have fueled cost overruns and triggered complaints that new radios are putting lives at risk.

"Our society has become such a technological monster that . . . public safety has just been overshadowed," said Alan Burton, an Oregon-based consultant on emergency communications.

Police and fire departments were once leaders in communications technology. In the 1920s, Detroit police unveiled the country's first one-way car radio. The development was quickly followed by two-way police radios. And soon, officers came to view their radios as an indispensable part of their crime-fighting arsenal.

Until the early 1990s, most police radios operated at frequencies that were 400 megahertz or less--the same frequencies used by the burgeoning wireless communications industry. The explosion of cell

phones and other technology sparked a modern-day "land rush" for radio frequencies.

Police and fire departments found themselves without space to add radio channels although their populations--and emergency call volumes--were rising. As calls flooded dispatch centers, officers had to wait in line to make a call--often delaying response times by crucial minutes.

The answer was for police to switch to higher, less crowded frequencies. But as a growing number of agencies made the conversion over the last few years, the limitations with these frequencies have become apparent.

The biggest complaint is that the radios don't always work in many big structures and throughout entire patrol districts. Experts say radio waves on higher frequencies cannot travel as far as those on the low frequencies previously used. To compensate, public safety agencies must add radio towers, which is often cost prohibitive.

Additionally, the technology is vulnerable to interference from wireless phone transmissions. Technicians have discovered that some cellular phone sites reduce nearby police radios to little more than static.

Fixing Problems Can Be Costly
Orange County began upgrading its system after years of complaints about slow response times, particularly during the Laguna Beach firestorm. But the initially promising 800-megahertz system quickly drew concerns.
In Tustin, for example, police couldn't hear dispatchers while inside their own headquarters until officials installed extra equipment to help. In an effort to improve coverage in buildings and reduce radio failures outside, technicians spent thousands of dollars adding equipment to the Tustin police building and boosted the strength of radio signals in Irvine.
Worried county officials delayed expansion of the network for more than five months while technicians worked on the glitches. Other agencies are only just getting ready to join the system.

Officials said they won't know the extent--or cost--of any additional improvements needed in Orange County until the entire system is up and running. Technicians hope it will be minimal, but other agencies such as police in Kansas City, Mo., and the Delaware State Police have placed the cost of patching holes in their new radio networks in the millions.

Despite the recent fixes in Irvine and Tustin, police continue to report that radios sometimes produce garbled messages and don't work in some large buildings. Meanwhile, some officers say they worry that the snafus might presage the kinds of serious failures seen elsewhere.

'This is supposed to improve public safety," said Irvine Sgt. Dave Mihalik, "not make it harder."

While no one has been hurt in Orange County, other agencies report more serious breakdowns.

"Dead spots" are reported elsewhere, including Portland, Ore., where a new 800-megahertz radio network was touted as state-of-the-art technology when it was installed in 1994.

In July, the Oregon OSHA fined the city $3,600 after determining that the radio system was already overtaxed and that failures sometimes prevent police officers from calling for help.

"Officers are disgusted," said Sgt. Lonn C. Sweeney, who filed the complaint. "I couldn't look my officers in the eye and send them out on the street."

One horror story cited about the potential danger of radio failures occurred in Atlanta on Oct. 12, 1997. That evening, two patrol officers confronted a man accused of hitting his girlfriend. The suspect quickly became aggressive, and one of the officers--Patricia Cocciolone--later testified that she radioed for help. But the call was never heard.

Moments later, the man emerged from his apartment with an assault rifle and unleashed a volley of shots. Cocciolone suffered wounds to her head, hip and hand. Her partner, Officer John Sowa, was killed.

Though it's arguable whether the call could have saved the officers, the episode shocked colleagues and focused attention on the transmission dead spots, said Chip Warren, vice president of the International Brotherhood of Police Officers, which represents Atlanta officers.

"This is putting officers' lives in danger," he said.

Yet building a radio system that will cover every inch of a city at all times is virtually impossible, especially those with large buildings or hilly areas, according to radio technicians.

"There are just places that radio waves won't go," said Pat Sturmon, a spokeswoman for Motorola Inc., which manufactures public safety radios. "If you have a budget, you can design anything you want it to do. But no system is perfect. There are always going to be dead spots in any system."

In 1995, police officers and firefighters in Kansas City, Mo., determined that their new, $18-million radio network failed in many areas of the city.

Frustrations soon erupted. Firefighters said the radios were so unreliable inside hospitals, malls and large apartment complexes that some had stopped taking them on calls.

One firefighter claimed his radio failed while he was in a burning building, forcing him to leap through a first-floor window to escape the flames.

In another case, two police officers said their radios failed to work when they were each shot during a foot chase. One of the wounded officers had to run in circles just to find a spot where the radio would work so he could call for help, they said in court records.

An independent review of Kansas City's communications system blamed weak signal strength for the problems and recommended adding antenna sites throughout the city. The cost to taxpayers to fix the problems: $10 million.

Sheriff's Officials Learn From Others

The seriousness is not lost on officials overseeing similar upgrades in Los Angeles.

In addition to hiring a consultant, the Sheriff's Department is talking to officials in Irvine and elsewhere to better understand the shortcomings of their systems and how to get the best possible coverage.

"We're going to look at what other people are doing," said Sheriff's Capt. Robert Sedita, who runs the department's communications and fleet management bureau. "People who have already gone through this have learned a lot."

The goal is to prevent similar problems--but many experts doubt that is possible as wireless phone sites mushroom to meet the relentless demand for personal communications.

And until engineers can build the "perfect" system, experts said, officers must continue to take into account the problems with coverage when using the radios. In some cases, that means requesting backup during even the most routine calls in areas where radio coverage is patchy.

"I haven't been encouraged that there is going to be a lot of improvement," said Harlin McEwen, chairman of the International Assn. of Police Chiefs' communications and technology committee.

"As [public safety] technology gets better, the rest of the world is not sitting still. . . . You give up old problems for new ones."

* * *

Static Over Police Radio
Police officers using Orange County's new 800-megahertz radio system report that missed calls from dispatchers, garbled messages and dead spots in office buildings threaten safety and response times.
* * *
OLD SYSTEM: 400 MEGAHERTZ

Longer wavelength travels better over hills and around buildings.
Lower frequency travels twice as far as new system
* * *
NEW SYSTEM: 800 MEGAHERTZ
Shorter wavelength delivers a clearer signal. But some agencies
report the signal has difficulty penetrating buildings.
Higher frequency needs extra towers to reach same distance
covered by old system

Thanks to Bob Reynolds for passing along a link that was floating
around on the Openness eGroups list. This article points out an
increased level of cooperation between the police and public
Web maps pinpoint crime activity

What we need to do now is print out copies and see that they get put
up on bulletin boards in every PD station across the country or at
least e-mailed to police chiefs for awareness. Then we need a national
campaign to further enforce this bond and perhaps coordinate with
neighborhoold watch programs by using scanners to aid citizens in
being that extra pair of eyes that law enforcement can use to their
advantage.

Such a plan, if effectively executed, would prove the importance of
scanner listeners which would hopefully cast our hobby in a more
favorable light. Just as amateur radio license holders are held in
high regard for the capacity they serve in times of emergency (which
usually exempts them from many laws), scanner listeners could hold a
similar rank for helping to police our communities and help apprehend
fleeing suspects.

From there we could only hope that this would create an awareness of
the importance of our efforts as hobbyists and prove to legislators,
based on actual cases, that we don't need more anti-monitoring laws
enacted because there is a group of invidividuals who are using
scanners for public safety

Web maps pinpoint crime activity
Chicago police take the lead in getting data to community

By Kevin Davis, Special for USA TODAY

CHICAGO ï¿½ With a few clicks of a mouse, Sandy Campbell can call up a
computerized map of his neighborhood to see where the latest crime
problems can be found.

Chicago's site, "Citizen ICAM," can be accessed at
www.ci.chi.il.us/CommunityPolicing.
A recent check of the Chicago Police Department Web site showed a

concentration of drug-related activity about two blocks from his house. In all, the map pinpointed 104 crimes ï¿½ from battery and prostitution to narcotics and telephone threats ï¿½ within a half-mile of Campbell's home during a week-long period.

"In a flash, it will show you where things are happening," says Campbell, a member of his local Chicago Alternative Policing Strategy, known as CAPS. "Once you get this information, you can ask the police what they're doing to combat this. Are they beefing up patrols in the area?"

Last month, Chicago police launched a Web site that allows the public instant access to crime information. Its designers say it is the most advanced crime information site for public use in the USA.

"I'm really excited that we now have this available," says Campbell, 62, a retired real estate broker who lives on the city's north side. "The whole idea is to identify problems and think of ways to cooperatively solve them. The police really do want citizens to be involved."

Anyone with access to the Internet can call up the site, type in an address, intersection or police beat, and instantly get information dating back 90 days. The screen will display a map of up to a 1-mile radius of an address and show color-coded icons where crimes were committed. Reports are a week old.

For those who want more information, crimes can be listed in a chart with their case numbers, block of occurrence and whether an arrest has been made. Specific addresses and names of victims are not included.

Getting people involved

Within days of its debut, the system was overloaded. In the first two weeks, police say, there were more than 210,000 hits on the site, causing the department to expand its computer server capacity. Police are hoping residents use the site for more than satisfying their curiosity.

Sgt. Jonathan Lewin, coordinator of the police technology unit, helped develop the system to get more people involved in community policing. "It's something we've been talking about for a number of years," Lewin says. "This reflects our commitment to citizens to give them access to information. One of the things we've been talking about is getting more tools for citizens to help fight crime."

Arthur Lurigio, chairman of the criminal justice department at Loyola University-Chicago, says this information can make a difference. "One of the tried and true methods of crime prevention is to avoid places where there is a lot of criminal activity such as robberies or sexual assaults," he says. "People can avoid these areas and lower their risk of victimization."

Residents can also work with police to change those areas.

"They can ask police to step up patrols, and they can step up their own activities, such as starting up their own crime-watch groups or citizen patrols, and it can get more people involved in community policing," Lurigio says.

That's what Campbell is hoping for. "I believe the more people use this, the better attended our beat meetings will be because people will want to talk about what's going on."

The Web site grew from an internal program available only to police, who used it for crime analysis. Now the public can work on a similar system. "Nobody provides this level of interaction with reports, updates and arrest information," Lewin says.

Though that might be true, Chicago isn't the first city to make crime information available on the Internet. The U.S. Justice Department has been encouraging the development of such systems for both police and citizen use. Other departments, as well as some newspapers, have taken crime reporting to the Web in various forms:

The New Orleans Police Department has a site that allows users to check monthly crime reports in specific districts. Users also can search for information on specific crimes.

In Evansville, Ind., The Evansville Courier & Press, in cooperation with police, has a Web site that maps felonies throughout the city.

The Red Bluff, Calif., Police Department has a site with monthly crime-analysis maps. Users can specify a crime, such as burglary or drunken driving, and view a map of the city showing where those offenses occurred.

The Houston Police Department offers citizens access to monthly crime statistics on its Web site. The tables include the type of crime, the location and the date and time it occurred.

A new openness

This openness represents a shift in police departments, which traditionally have kept information to themselves.

"The initiative to share it with the public is really something new," says Robert Friedmann, chairman of the department of criminal justice at Georgia State University and an expert on community policing. "This is a promising development in law enforcement."

Campbell says this openness also helps strengthen the relationship between police and the public. He says residents often blame police for problems and expect them to solve them. "What began as an adversarial relationship has settled into something more cooperative."

Chicago police plan to improve their computer system in the coming months. The department soon will create a feature to allow parents to

type in their address and see a map showing the safest route to school, as well as safe havens where children can go if they feel threatened or encounter a crime. The map will show little footprints for children to follow.

Friedmann says that although the system has its merits, it can also be abused. Unscrupulous lenders or insurers, for example, could use the maps to "redline" ï¿½ refuse to provide service to certain areas. But "in all, I think the more information you give out to the public, to a point, is good," he says. "You get the message that the police department is open to the community."

The instance that I encountered wasn't as extreme as the examples given, BUT... I was an MP stationed at Ft. Campbell when in 1998(?) a helicopter crashed at the begining of my shift, before we even got on the road. We were using a 400 mhz trunked system (they still use it to this day). In theory it's good because several departments can use one radio system - except in a serious incident like this... in case you're not familiar with how trunked systems work, I'll explain it basically...

A trunked system will allow several agencies to use one system without dedicating specific frequencies to each one. There is a bank of frequencies - let's say in this instance 10. We'll say there are 15 agencies that want to talk. When one keys up, they use one of the available 10 frequencies. When they unkey, that frequency becomes available and the next time they key up, they might be on another. This is possible because of high-tech radios that track different "talk groups". See how this can be handy? Less frequencies for more agencies? This also makes it difficult for non-trunk tracking scanners to listen in.

Well, that morning of the helicopter crash, EVERY agency was talking on the trunked system, tying it up. What created more havoc is that once you key your trunked radio, you are put in a sort of "wait mode". When a frequency becomes available, your radio beeps and you have a couple seconds to key your radio... people were keying their radio, not getting a response because there were no frequencies available, and then when the radio beeped to tell them to talk, they couldn't key up the radio fast enough..

This resulted in me not being able to talk to my dispatcher for as long as a 1/2 at a time, putting me and the other officers in great risk! A valuable lesson - have more frequencies then you have talk-groups!

Like I have pointed out in the NG several times, the police are experts at
have private ("secure") back channels for their comms. In Lexington they used
to use CB CH37 and operated simplex in the 2mtr ham band. (only 1 or 2 where
hams). They have switched to cell phones and no PCS. While I would never, ever
listen to a ECPA protected communication inderstand from those that are not so
law abiding that the cell conversations are frightening. Even in a (realtive)
clean department, where the chief at least tries to keep it clean, there are
lots of comms regarding illegal activities. With PCS the up and comming things
no one will be able to monitor their criminal activities.
Again, the police are not your friends. They are not their to protect and
serve, they are the kings army designed to protect the politcal power
structure. The good cops allowed the "few bad apples" to spoil the whole
barrel. The Rampart section in LA is not even the tip of the iceburg.
You should be afraid, very affraid of ALL police.
They devide the world into three groups:
1)Cops
2)Cops families
3)Suspects no yet proven to be perps...

:
: Web maps pinpoint crime activity
:Chicago police take the lead in getting data to community
:
:By Kevin Davis, Special for USA TODAY
:
:CHICAGO ï¿½ With a few clicks of a mouse, Sandy Campbell can call up a

:computerized map of his neighborhood to see where the latest crime
:problems can be found.
:
:Chicago's site, "Citizen ICAM," can be accessed at
:www.ci.chi.il.us/CommunityPolicing.
:A recent check of the Chicago Police Department Web site showed a
:concentration of drug-related activity about two blocks from his
:house. In all, the map pinpointed 104 crimes ï¿½ from battery and
:prostitution to narcotics and telephone threats ï¿½ within a half-mile
:of Campbell's home during a week-long period.
:
:"In a flash, it will show you where things are happening," says
:Campbell, a member of his local Chicago Alternative Policing Strategy,
:known as CAPS. "Once you get this information, you can ask the police
:what they're doing to combat this. Are they beefing up patrols in the
:area?"
:
:Last month, Chicago police launched a Web site that allows the public
:instant access to crime information. Its designers say it is the most
:advanced crime information site for public use in the USA.
:
:"I'm really excited that we now have this available," says Campbell,
:62, a retired real estate broker who lives on the city's north side.
:"The whole idea is to identify problems and think of ways to
:cooperatively solve them. The police really do want citizens to be
:involved."
:
:Anyone with access to the Internet can call up the site, type in an
:address, intersection or police beat, and instantly get information
:dating back 90 days. The screen will display a map of up to a 1-mile
:radius of an address and show color-coded icons where crimes were
:committed. Reports are a week old.
:
:For those who want more information, crimes can be listed in a chart
:with their case numbers, block of occurrence and whether an arrest has
:been made. Specific addresses and names of victims are not included.
:
:Getting people involved
:
:Within days of its debut, the system was overloaded. In the first two
:weeks, police say, there were more than 210,000 hits on the site,
:causing the department to expand its computer server capacity. Police
:are hoping residents use the site for more than satisfying their
:curiosity.
:
:Sgt. Jonathan Lewin, coordinator of the police technology unit, helped
:develop the system to get more people involved in community policing.
:"It's something we've been talking about for a number of years," Lewin
:says. "This reflects our commitment to citizens to give them access to
:information. One of the things we've been talking about is getting

:more tools for citizens to help fight crime."
:
:Arthur Lurigio, chairman of the criminal justice department at Loyola
:University-Chicago, says this information can make a difference. "One
:of the tried and true methods of crime prevention is to avoid places
:where there is a lot of criminal activity such as robberies or sexual
:assaults," he says. "People can avoid these areas and lower their risk
:of victimization."
:
:Residents can also work with police to change those areas.
:
:"They can ask police to step up patrols, and they can step up their
:own activities, such as starting up their own crime-watch groups or
:citizen patrols, and it can get more people involved in community
:policing," Lurigio says.
:
:That's what Campbell is hoping for. "I believe the more people use
:this, the better attended our beat meetings will be because people
:will want to talk about what's going on."
:
:The Web site grew from an internal program available only to police,
:who used it for crime analysis. Now the public can work on a similar
:system. "Nobody provides this level of interaction with reports,
:updates and arrest information," Lewin says.
:
:Though that might be true, Chicago isn't the first city to make crime
:information available on the Internet. The U.S. Justice Department has
:been encouraging the development of such systems for both police and
:citizen use. Other departments, as well as some newspapers, have taken
:crime reporting to the Web in various forms:
:
:The New Orleans Police Department has a site that allows users to
:check monthly crime reports in specific districts. Users also can
:search for information on specific crimes.
:
:In Evansville, Ind., The Evansville Courier & Press, in cooperation
:with police, has a Web site that maps felonies throughout the city.
:
:The Red Bluff, Calif., Police Department has a site with monthly
:crime-analysis maps. Users can specify a crime, such as burglary or
:drunken driving, and view a map of the city showing where those
:offenses occurred.
:
:The Houston Police Department offers citizens access to monthly crime
:statistics on its Web site. The tables include the type of crime, the
:location and the date and time it occurred.
:
:A new openness
:
:This openness represents a shift in police departments, which

:traditionally have kept information to themselves.
:
:"The initiative to share it with the public is really something new,"
:says Robert Friedmann, chairman of the department of criminal justice
:at Georgia State University and an expert on community policing. "This
:is a promising development in law enforcement."
:
:Campbell says this openness also helps strengthen the relationship
:between police and the public. He says residents often blame police
:for problems and expect them to solve them. "What began as an
:adversarial relationship has settled into something more cooperative."
:
:Chicago police plan to improve their computer system in the coming
:months. The department soon will create a feature to allow parents to
:type in their address and see a map showing the safest route to
:school, as well as safe havens where children can go if they feel
:threatened or encounter a crime. The map will show little footprints
:for children to follow.
:
:Friedmann says that although the system has its merits, it can also be
:abused. Unscrupulous lenders or insurers, for example, could use the
:maps to "redline" ï¿½ refuse to provide service to certain areas. But
:"in all, I think the more information you give out to the public, to a
:point, is good," he says. "You get the message that the police
:department is open to the community."

Let's face it, the police ALREADY conduct all of the alledged activities in this article regardless of the dispatch and radio technology in the car - it's called a cell phone and you can't hear 'em (OK - then digital PCS for those of you who can hear cell).

:classified: UNCLASSIFIED
:
: While this has to do with LAPD,
: the same problems will show up
: here in Indiana, and even overseas.
:
:Police Say Radios Too Low-Tech
:By JACK LEONARD, Times Staff Writer
:
:
: But that was before sprawling office towers and parking
:structures started blocking radio waves. And before wireless
:phones--with their crystal clear reception--upped expectations for
:two-way communication, while at the same time stealing frequencies
:from radio users.
:
: Now, it seems, in this era of technological innovation, the
:crackling police radio is starting to show its age.
:
: Police and fire agencies across the country are using antiquated
:equipment developed in the 1950s and '60s that has failed in major
:emergencies, including the 1992 Los Angeles riots and 1993 Laguna
:Beach firestorm.
:
: That problem is prompting departments to spend hundreds of
:millions on cutting-edge radio networks, only to encounter many
:new--and sometimes dangerous--breakdowns.
:
: In one extreme case in Atlanta, a new police radio network failed
:to pick up an officer's call for help just moments before a
:rifle-wielding suspect wounded her and killed her partner. In
:Delaware, firefighters resorted to shouting out of windows because
:their $50-million communications system didn't work inside high-rise
:buildings.
:
: In Los Angeles, police use a 21-year-old network so out of date
:that manufacturers have stopped making parts for it. For years,
:cash-strapped technicians had to cannibalize parts from some hand-held
:radios to fix others. The problems reached a crisis during the 1992
:riots, when officers in the field faced a critical shortage of
:portable radios.

:
: The city is installing a new system.
:
: Orange County began rolling out an $80-million network earlier
:this year and experienced its own static--including several incidents
:that police insist put their safety at risk. This summer, Irvine
:officers complained that new radios failed to pick up critical
:information from dispatchers during an office building search for a
:murder suspect.
:
: "I think we've gone backward instead of forward," said Irvine
:Police Officer Jeff van der Sluys Veer. Some of his colleagues now
:rely on their own cellular phones and pagers, he said, "anything they
:can to maintain communications."
:
: The problem is part physics and part finances.
:
: The design of police radio systems makes it difficult for signals
:to penetrate the heavy steel and concrete of office buildings, parking
:garages, shopping malls and even hospitals. As these structures
:sprout, they present major obstacles for officers trying to keep in
:touch with each other.
:
: Wireless phones also operate with radio waves, but engineering
:experts say they often provide far better service than police radios
:because the telephone companies place more radio towers in highly
:developed areas. Local governments simply don't have the money to
:match that kind of coverage--even with state-of-the-art systems.
:
: The problems are being closely watched in cities across the
:nation. The Los Angeles County Sheriff's Department, which also is
:building a new radio system, has hired a consulting firm to study the
:problems elsewhere and make recommendations.
:
: The quality of radio service varies greatly--even among agencies
:purchasing the same type of advanced systems. San Diego's new network
:is similar to Orange County's, but officials there said they've
:experienced few problems and are generally happy with it.
:
: In dozens of cities, however, police and fire officials have
:faced signal failures in patrol areas and inside malls, hospitals and
:even their headquarters. In many cases, the breakdowns have fueled
:cost overruns and triggered complaints that new radios are putting
:lives at risk.
:
: "Our society has become such a technological monster that . . .
:public safety has just been overshadowed," said Alan Burton, an
:Oregon-based consultant on emergency communications.
:
: Police and fire departments were once leaders in communications

:technology. In the 1920s, Detroit police unveiled the country's first
:one-way car radio. The development was quickly followed by two-way
:police radios. And soon, officers came to view their radios as an
:indispensable part of their crime-fighting arsenal.
:
: Until the early 1990s, most police radios operated at frequencies
:that were 400 megahertz or less--the same frequencies used by the
:burgeoning wireless communications industry. The explosion of cell
:phones and other technology sparked a modern-day "land rush" for radio
:frequencies.
:
: Police and fire departments found themselves without space to add
:radio channels although their populations--and emergency call
:volumes--were rising. As calls flooded dispatch centers, officers had
:to wait in line to make a call--often delaying response times by
:crucial minutes.
:
: The answer was for police to switch to higher, less crowded
:frequencies. But as a growing number of agencies made the conversion
:over the last few years, the limitations with these frequencies have
:become apparent.
:
: The biggest complaint is that the radios don't always work in
:many big structures and throughout entire patrol districts. Experts
:say radio waves on higher frequencies cannot travel as far as those on
:the low frequencies previously used. To compensate, public safety
:agencies must add radio towers, which is often cost prohibitive.
:
: Additionally, the technology is vulnerable to interference from
:wireless phone transmissions. Technicians have discovered that some
:cellular phone sites reduce nearby police radios to little more than
:static.
:
: Fixing Problems Can Be Costly
: Orange County began upgrading its system after years of
:complaints about slow response times, particularly during the Laguna
:Beach firestorm. But the initially promising 800-megahertz system
:quickly drew concerns.
: In Tustin, for example, police couldn't hear dispatchers while
:inside their own headquarters until officials installed extra
:equipment to help. In an effort to improve coverage in buildings and
:reduce radio failures outside, technicians spent thousands of dollars
:adding equipment to the Tustin police building and boosted the
:strength of radio signals in Irvine.
: Worried county officials delayed expansion of the network for
:more than five months while technicians worked on the glitches. Other
:agencies are only just getting ready to join the system.
:
: Officials said they won't know the extent--or cost--of any
:additional improvements needed in Orange County until the entire

:system is up and running. Technicians hope it will be minimal, but
:other agencies such as police in Kansas City, Mo., and the Delaware
:State Police have placed the cost of patching holes in their new radio
:networks in the millions.
:
: Despite the recent fixes in Irvine and Tustin, police continue to
:report that radios sometimes produce garbled messages and don't work
:in some large buildings. Meanwhile, some officers say they worry that
:the snafus might presage the kinds of serious failures seen elsewhere.
:
: 'This is supposed to improve public safety," said Irvine Sgt. Dave
:Mihalik, "not make it harder."
:
: While no one has been hurt in Orange County, other agencies report
:more serious breakdowns.
:
: "Dead spots" are reported elsewhere, including Portland, Ore.,
:where a new 800-megahertz radio network was touted as state-of-the-art
:technology when it was installed in 1994.
:
: In July, the Oregon OSHA fined the city $3,600 after determining
:that the radio system was already overtaxed and that failures
:sometimes prevent police officers from calling for help.
:
: "Officers are disgusted," said Sgt. Lonn C. Sweeney, who filed the
:complaint. "I couldn't look my officers in the eye and send them out
:on the street."
:
: One horror story cited about the potential danger of radio
:failures occurred in Atlanta on Oct. 12, 1997. That evening, two
:patrol officers confronted a man accused of hitting his girlfriend.
:The suspect quickly became aggressive, and one of the
:officers--Patricia Cocciolone--later testified that she radioed for
:help. But the call was never heard.
:
: Moments later, the man emerged from his apartment with an assault
:rifle and unleashed a volley of shots. Cocciolone suffered wounds to
:her head, hip and hand. Her partner, Officer John Sowa, was killed.
:
: Though it's arguable whether the call could have saved the
:officers, the episode shocked colleagues and focused attention on the
:transmission dead spots, said Chip Warren, vice president of the
:International Brotherhood of Police Officers, which represents Atlanta
:officers.
:
: "This is putting officers' lives in danger," he said.
:
: Yet building a radio system that will cover every inch of a city
:at all times is virtually impossible, especially those with large
:buildings or hilly areas, according to radio technicians.

:
: "There are just places that radio waves won't go," said Pat
:Sturmon, a spokeswoman for Motorola Inc., which manufactures public
:safety radios. "If you have a budget, you can design anything you want
:it to do. But no system is perfect. There are always going to be dead
:spots in any system."
:
: In 1995, police officers and firefighters in Kansas City, Mo.,
:determined that their new, $18-million radio network failed in many
:areas of the city.
:
: Frustrations soon erupted. Firefighters said the radios were so
:unreliable inside hospitals, malls and large apartment complexes that
:some had stopped taking them on calls.
:
: One firefighter claimed his radio failed while he was in a burning
:building, forcing him to leap through a first-floor window to escape
:the flames.
:
: In another case, two police officers said their radios failed to
:work when they were each shot during a foot chase. One of the wounded
:officers had to run in circles just to find a spot where the radio
:would work so he could call for help, they said in court records.
:
: An independent review of Kansas City's communications system
:blamed weak signal strength for the problems and recommended adding
:antenna sites throughout the city. The cost to taxpayers to fix the
:problems: $10 million.
:
:
: Sheriff's Officials Learn From Others
:
: The seriousness is not lost on officials overseeing similar
:upgrades in Los Angeles.
:
: In addition to hiring a consultant, the Sheriff's Department is
:talking to officials in Irvine and elsewhere to better understand the
:shortcomings of their systems and how to get the best possible
:coverage.
:
: "We're going to look at what other people are doing," said
:Sheriff's Capt. Robert Sedita, who runs the department's
:communications and fleet management bureau. "People who have already
:gone through this have learned a lot."
:
: The goal is to prevent similar problems--but many experts doubt
:that is possible as wireless phone sites mushroom to meet the
:relentless demand for personal communications.
:
: And until engineers can build the "perfect" system, experts said,

:officers must continue to take into account the problems with coverage
:when using the radios. In some cases, that means requesting backup
:during even the most routine calls in areas where radio coverage is
:patchy.
:
: "I haven't been encouraged that there is going to be a lot of
:improvement," said Harlin McEwen, chairman of the International Assn.
:of Police Chiefs' communications and technology committee.
:
: "As [public safety] technology gets better, the rest of the world
:is not sitting still. . . . You give up old problems for new ones."

>still bitch and complain in a few years because they are outdated (as newer
>one come out). It is almost impossible to stay on top with the latest
>technology unless you have a unlimited source to the taxpayers money like
>the NSA, FBI, DEA and SS.

I don't think three of the four have much of a budget to run state of the art. Last time I looked, they were still using Micor bases, Syntor X-9000 mobiles with HHCH/ ASNsecurity housings and Saber portable radios. In fact, check out:

http://www.pswn.gov

to see the initiative to consolidate federal systems, form partnerships with local governments and reduce the amount of freestanding "stovepipe" systems around the nation.

>Local government has to go through the channels to spend the $$$$.

I work for a county government and our purchasing policies for anything over $500 are excruciating. Capital purchases have to go through many levels of scrutiny before they are approved and you'll find a statue of San Carlos de Borromeo is more of a priority than many other public safety initiatives.

Despite all of this, we have just installed a Project 25 system using XTS-3000R digital radios and Quantar repeaters. Our analog operations are still in place and over 90% of all communications is conducted in analog. 9% of the digital transmissions are side by side comparisons evaluating the performance of P25 digital vs. analog. The remaining 1% is confidential information and is encrypted.

>Before long you will never again hear your big city local police on a
>scanner.

Not quite true.

>Every big city will soon be able to afford digital radios that with
>the touch of a button can change binary codes

The method commonly accepted is IMBE vocoding and 4 slot PSK, not binary. This is called APCO Project 25 and IS NOT encryption, by any means! In fact, you could probably use this technology in the amateur service, because it's an open architecture code and is not encrypted.

My initial observations of digital vs. analog is that digital will go down to the noise floor and start to break up. This is past the point where analog gets very noisy and squelches. Now, digital audio is funky. It sounds like you are "under water" or blowing bubbles in the background. Also, get used to silence in between words and syllables.

While there may be a push to go digital, I don't think most field personnel would be happy with the audio quality (which I would say is not quite as good as Nextel in direct connect mode).

>and even IF the FCC allows
>digital scanners to be produced AND sold in the good ole US of A, you won't
>be able to keep up with the codes to monitor them.

The FCC has no control over who manufacturs what with the exception of blocking wireless. Type acceptance is largely a process that limits the amount of radiating energy. There is no "red light" / "green light" to manufacture digital receivers. In fact, I heard rumors that Uniden, a signator to P25, is developing a digital scanner.

In the very near future, everyone should be able to monitor P25 digital modulation that is UNENCRYPTED. DES-OFB (Digital Encryption Standard - Output Feedback) is a common digital format where the vocoded data is run through DES encryption and transmitted. this option is very inexpensive in a digital radio when it's compared to DES-XL or DVP-XL in analog radios. The key code combinations are the same; an astronomical combination of codes.

>The smaller town are still looking at smaller funds....so they won't be able
>to go digital for another 5 to 10 years so people like me are OK for now. I
>do feel sorry for all you big city scanner nuts! My local police uses
>460.025 and voice inversion :-)

In 2005 (Jan 1) EVERYONE will be compelled to do SOMETHING. At that time, licenses for adjacent channels 7.5 kHz away for VHF or 12.5 kHz for UHF will necessitate at least narrowbanding by reducing emmissions to occupy only a 11.25 kHz channel width. Did you catch the problem? VHF channels are separated by 7.5 kHz and you have an 11.25 kHz wide signal - VHF users will experience adjacent channel interference even when narrowbanded.

>I really believe that a police agency that wants to hide every transmission
>from us is going to become the secrete police!

I do, too. It's only a tool, like an axe or a gun. You don't use it all of the time, just when necessary.

>LET THE PUBLIC MONITOR all
>conversations except very important stuff like deaths (names) from car
>wrecks, drug busts, and vital private information. What does it hurt for use
>to hear traffic stops, general dispute calls, fire calls, ambulance calls
>and donut breaks??????? What the heck do they have to hide? Use DVP for the
>private stuff and keep everything else in the clear!
>

>Just one scanner nuts opinion!
>Take it or leave it.

While I do this professionally, it's one of my hobbies, too (I have an Icom R7000 and tune around to hear who uses what freq and CTCSS). The situation is much less insidious when you gather up facts, know the background and suppress runaway imaginations. Dare I say, like 800 conventional in 1980, 800 trunked in 1984 and digital now, any administrator who buys an **unencrypted** radio system with the intent to obfuscate radio transmissions simply by relying on technology that's a few steps ahead of scanning technology will be severely disappointed.

No, son, freedom of speech is a precious thing but what you are doing is not considered protected speech under that wonderful clause... You, sir, are a spammer... And not a very smart one at that...

So go off and play with your G.I. Joe dolls while you feverishly finger your latest issue of SOF magazine... You're a comic book commando who couldn't buy the muddied ones a draft at the NCO club if you had a million dollars...

You're a phony, pure and simple... Or you could just post your DD Form 214 to prove otherwise...

Put up or shut up, yenni...

The "IDL" is a translation of your home DL. If you're an American overseas, your home state license is valid by itself in most Western European countries. The IDL is still handy to have, as a translation into multiple languages so the local cop has at least a chance of knowing what you're legal to drive... In other countries, the IDL is required - but so is you home license with it.

The reverse is also true. Someone from France visiting here, for example, does *not* need an IDL to be legal to drive in the States. But if that French person were pulled over in Montana, it sure would be nice to have that tanslation handy. If that foreign person *just* has an IDL, you aren't licensed, as far as our laws are concerned.

Funny this should come up now.

Our old radios weren't so hot. They were supposed to install repeaters, but being a nationwide agency who may travel hundreds, even thousands of miles away from our duty station, this wasn't much of a plan. Our radios would work with perhaps two or three other duty stations, and no more, since they each had their own codes and frequencies.

They were iffy enough that I bought and carry my own cell phone, and 90% of it's use is work related.

They demanded we turn in our radios so they can be reprogrammed. After we (I "forgot" to turn mine in, and I'm sticking to it:-)) turned them in, we were informed they would not be returned. We would get a "new" and "better" system.

One of our offices just got Nextel phones. I'm thinking "Hey, somebody got smart! A nationwide communication system that's already proven!" We were informed that we "may" not get the same exact thing.

I just caught a peek at our new radios. They look a lot more fancy than the old ones, but alas, they too need repeaters, and they are not compatible with our old system.

I'm waiting for either smoke signals or the tried and true can/string system.

Pagan

Trunked radio systems, nowadays, are a necessity if you're trying to pur a number of agencies together on one system and you 're asking for a number of frequencies (more than 4). Simply put, the FCC wants you to trunk so that you get the most efficiency out of the frequencies you're granted.

Andy makes a good point, but we'll probably never see too many trunked system that have more channels than talk groups --- there would be no reason to trunk. But what's really happening is that everyone gets so excited at the new capabilities trunking brings - the ability to finally get the Detectives their own "frequency", and the Animal Control Officer, and the Public Works Garage, anbd on, and on, and on, that it becomes Politically impossible to say "No" to someone with 'pull' who wants their own talk group.

Trunking, after all, is the way the phone companies have dealt with inter-office telphone calls for a long, long time. They have a pretty good idea of how many trunbks are really needed so that "blocking" (what Andy is talking about here) is kept an an acceptably low level. One of the ways to minimize blocking of emergency traffic is to properly assign priority levels, as well as resisting the temptation to keep adding talk groups. I'd guess (and it is just a guess) that that wasn't the case with the system Andy is referring to.

Without passing judgement on Andy's system (you'd need a *lot* more information about it before you could responsibly do that) I think its a shame that there are so many poorly-designed trunked systems out there. The advantages to public safety agencies of a properly-designed trunked system are so many, *especially* in times of wide-spread disaster, that we wouldn't want agencies shying away from investing in them or participating in them because of well-founded fears of inadequate system design.

Does anyone know if there's anything to be heard in the Mil. aero band?
I'd like to use this portion of my scanner's range! Anyone got any good
freqs? I used to have stuff programmed years ago that I got from a mag but
I never heard anything. Thanks.

So why limit getting familiar to, to just these 3 out of 9 HF Ham bands?

If you are serious about getting your ticket the WWW is a wealth of information and you should try some www.dogpile.com searches.

Good general Ham references can be found at http://www.area-ham.org/library/libindex.html and another good starting point would be http://www.wm7d.net/ . Guess we shouldn't ignore www.arrl.org .

You will find a number of sites that allow you to practice taking your FCC license exam. If you get to the point you easily pass those tests you will ace the real thing.

Glenn

BTW: Seems odd that our resident VE spends all his time posting nonsense/flames rather than helping out a person wanting to become a ham. :-)

This is really something! It should be obvious to anyone that communications privacy is a requirement for effective police work, and a great benefit in other kinds of public service communications. Would you like your name and condition being monitored by entertainment-oriented listeners when you're being treated by paramedics? How about if your house is on fire? I know that some people would like to get their thrills by listening in to a developing stake-out, a sting operation or a raid, but it's clear that this could also endanger the lives of the officers involved. As for monitoring the police bands in a "watchdog" mode -- this is of marginal value at best. Voyeuristic giggles and thrills just aren't worth the loss of privacy and security.

The current team has performed no EVA's since arrival on station.

However the lower voice you heard possibly was the ground control being heard in close proximty to the mike one of the team was using....? That's my best guess....I've heard that too...and assumed it was ground station via the ISS station's mike. If not that, perhaps it's the second Russian team member but I would ahve expected his voice to be the same level.

I, for one, agree with Curt here, and if you think that having some citizens listening in on the Police will prevent/slow down/inhibit corrupt or illegal activity, then you've got to wonder why you pay a Police Chief.--- or have a Polcie Commission. Fact is, everyone knows that radio channels, phone channels, *and* MDT channels have been recorded for a long time, and it doesn't take a rocket scientist of a cop to figure out that if he/she wants to plan something illegal or in violation of department rules, they'll meet in person with their other cohorts. Or use their cell phones. Or "click three times" with their mic.

On the other hand, carrying a scanner tuned into the local (unencrypted) police channel is probably a job requirement for burglars here. Bad guys know the address of the place they have just broken into, and they can listen just like the law-abiding citizens and bail out when they hear their address called.

You ought to come up here to Maine, where they literally have a "license to kill". A cop killed a guy in Mexico , Maine, BECAUSE OF A TRAFFIC VIOLATION, and got away with it, Scott free. Another time, they went to a ladies house, who had been acting oddly, and how long did they wait before they used deadly force ? 12 MINUTES ! They then shot that person dead. Even the Attorney General of the state said that if he could find any charges to file against them, he would. How about cops that sell drugs ? How about cops that molest kids, and then get a slap on the wrist in court (served 30 days, when the regular sentence is 5 years). We have, in my own county, a cop that is a known CONVICTED FELON. When a cop screws up, they dont prosecute, they just ship him out to another department. This prevents them from getting a "black eye" themselves. They dont want the truth out in the open, and they will use any means to hide it. How about a cop that simply shoots at people he doesn`t like, when he sees them on the street at night ? No judges, courts, or juries here ! Such things are viewed as a "waste of the taxpayer`s money" ! How about a state where they have to actually pass a law to stop the cops from railroading guys into jail so they can fool around with their wife ? (I personally listened to this being discussed right on the radio.) What do they have to hide ? How about a cop that thinks his badge is a license to SHOOT his ex-wife`s boyfriend ? Yes, indeed ..... they have a LOT to hide..... I could go on for at least 10 more paragraphs.....

I have another post from Florida about how the news media
is referring to the encryption of police frequencies as "secret
police". The concern is that the police has sometime to hide.

Face it, how hard would it be for a group of cops to get a commo
tech to create a new talk group that none of the leadership has?
With encryption, no one could intercept it, not even dispatch
(therefore it could not be recorded).

As it is, police are using out of band CBs to coordinate less than
professional activities. It is not in the best interest of the
department nor the public.

Plus how do you coordinate with other departments, or even
other patrol areas? Scanners would allow inter agency monitoring.
We already have a situation in Indianapolis were the deputies
transporting prisoners do not have the bailiff's talk groups nor
IPD downtown. Therefore they can talk directly with either
department. And locally, we have the county ambulance service
not wanting the fire departments on their talk groups. That means
that there is no coordination, not even to talk an ambulance into
an accident scene.

In the end, I believe that you will need a court order to be allowed
to use encryption, and then with limits as to time and situation.

Mr Breneman,

Using the logic you just used, you could just as well ban newspapers. Would <<you>> want someone reading about your "arrest" after you robbed a bank? You could ban newscasts that cover police shootouts, or just ban TV altogether.

You are forgetting that intrinsic to government OF, BY, and FOR the people is their RIGHT to know! This is EXACTLY what the socialists are looking for, as well as our enemies. Since we STILL have the right to bear arms, the ones who would take your freedoms away can't very well just say, OK, you now have to give up your guns, newspapers, books AND scanners. They would be mowed down. But they CAN, using seemingly innocent attitudes like yours, use very small issues to build a found-ation for their hidden agenda. Using issues that sound good, public safety regulations, etc, they "condition" people to accept even more strictures on their freedoms. For example, I believe in seat belts. I've worn them since 1967. But it should NOT be a law that you have to wear them. It does sound good, so people lamely allow their state legis latures to pass laws restricting their right to decide for themselves. More conditioning. More foundation for the reduction of freedom to the public and more government control of the public.

An informed public is the police departments' best ally. Anytime police have something to fear from those it is charged to protect--that is, law abiding citizens---there is something wrong within the department and it's the OFFICERS who need to be changed, not the listening habits of the general public.

jeffreyh@Hawaii.Edu (Jeffrey Herman) writes:

>>This is an international newsgroup.

>No. This NG (rec.radio.amateur.misc) is *propagated* internationally.
>Period. It's not (nor was it ever) intended to be a dumping ground
>for non-U.S. topics. There are newsgroup hierarchies for uk.radio.*,
>aus.radio.*, et cetera. Peruse those groups if you're interested in
>non-U.S. articles.

These newsgroups are propagated and *contributed to* internationally.
They are for discussion of various radio topics wherever they happen.
There is NOTHING that suggests that rec.* groups should be in any way
specific to the USA.

There are *also* newsgroups specific to certain regions that may contain
stuff specific to those regions. If readers in the USA want a newsgroup
for USA-specific stuff, they could set up a usa.radio.* newsgroup. But
the rec.* groups are open to things happening anywhere.

Now, many international readers would be happy if USA members *would*
set up a country-specific newsgroup and take certain discussions there,
for example the USA presidential elections. But mostly we don't complain
about all the USA-specific content. It's the height of arrogance, though,
to suggest that USA content *belongs* here and non-USA content does not.
Radio-related news from Edmonton belongs here just as much as radio-related
news specific to the USA, particularly all the FCC stuff.

And don't use the "the USA started the Internet" excuse. Usenet was
originally relatively independent of the Internet, and was international
almost from the start. Even back when Usenet had only 30 sites, some
of those were outside the USA. Right from the beginning, most newsgroups
were international. I've been reading and posting to Usenet since 1981,
all of it from outside the USA.

Dave

PS: I see that Jeffrey "cleverly" set the Followup-to header so that
all followups would go to rec.radio.cb - not even one of the original
newsgroups. In other words, he wants anyone else's comments to not
be seen by anyone following the thread. I've reset the Newsgroups
to what they were.

>Dear Steve & alia,

Who is Alia?

>If officers used high tech radio sets, is their onto some danger that they
>would argue that they were too complicated for normal use,

Perhaps. Generally, though, these high tech features are embedded and
the radio operates transparently to the end-user. At least a well
designed system does. The average officer does not use features such
as "private call" or "call alert" and those features that appeared
nifty to administrators are quickly forgotten by field operatives.

>except where
>encrypted traffic is needed to deal with using high tech radios.

I use encrypted radios every day. I've programmed the radio to be
manually toggled into transmitting encrypted, but receive is
automatically switched without operator intervention. All that is
required is to flip the switch on the channel selector knob to the "�"
symbol and if a valid keyload is retained in the radio, all you do is
talk. If not, the radio will beep incessantly. Then, you can't pass
sensitive traffic. Not very complicated.

By the way, despite having encryption, we believe in openness and the
public's right to hear routine traffic. 98% of our traffic is passed
unencrypted, but names and situations requiring coordinated public
warning are not.

>Also, what
>would the overall cosst of taxpayers money to establish a new network of
>high tech radios & support network of repeaters & operators such as
>dispatchers to ensure that communication were effective for users concerned.

By high tech radios I am assuming that this is a radio with enhanced
features that can operate in a digital and trunked platform, which may
not seem very high tech to the end user; the high tech being in the
infrastructure.

Each new site construction is approximately � 1.4M
Each new radio is approximately � 2,600 (this is for full-featured
units, less features in an analog radio may be had for half that.

Generally complete communications infrastructure ranges from $ 3.5M - $ 21M depending on terrain, number of sites required, percentage of coverage, etc. This cost may also include microwave infrastructure to link the sites, GPS or Rubidium standards for simulcasting synchronization and remote control console equipment.

Heard the ISS clearly on Thursday 11/9 in Northern Ohio from 1937 to 1942 GMT. I heard Two different voices, one signal stronger than the other, both in Russian, seemingly in conversation. I wouldn't think that I could hear the groundstation from here. Does anyone know the locations of groundstations in the USA authorized to talk to ISS? Is it possible that I was hearing module-to-module communication on that frequency? Possibly was it an EVA event I was hearing?

2402. Re: ISS on 143.625

I heard the same stuff at the same time (approximately) here in Connecticut. It was clear that they're running full duplex - you could hear the other guy (ground) in Russian but in the background - much lower. The mix was either audio - you could actually hear the microphone 'creak' at one point --- or there's just a little 'sidetone' built into the system.

> make sure he's legit before selling him a gun?

Criminals don't get their guns legally because they cannot. Are
you suggesting
that we change this? Where do you suppose the guns come from?
Do you think the guns are obtained illegally at every point in
the supply chain? If we are to allow "honest Joe Smith the
homeowner" to get in the business of selling guns to other
individuals, then we should bring the full force of law into play
to ensure that he doesn't sell the gun to criminals, children,
the insane, etc.

> > There's also the issue of those
> >otherwise law abiding citizens with guns who don't properly
> >secure their weapons so that their children get hold of them.
>
> That's right and it's up to them to educate their children about
> guns and their safety.

It is up to them. But because it affects others, it's also up to
us to ensure that this responsibility isn't shirked. It's also
up to them to prevent their children from taking the weapon and
ammunition. Law enforces this responsibility. Registration
makes for accountability.

>
> >Perhaps registration brings with it better awareness of
> >regulations and safety?
>
> It hasn't worked before, it's not working now and it won't work in
> the future.

Are you saying that registration doesn't prevent weapons from
falling into the hands of children, that registration doesn't
prevent accidents? I fail to how doing nothing will work better.

> EDUCATE THE CHILDREN and KEEP THE GUNS LOCKED UP WHERE
> THEY CAN'T GET AT THEM.

This is good advice regardless of anyone's position on
registration. And a system of registration does nothing to
prevent anyone fromn following this advice.

> Laws are not designed for criminals, we call
> them criminals for a reason....

Huh?

I got a RS2006 a month ago. I'm a complete newby to scanning.
I've been lurking in this newgroups(s) for several months...
.......I've got a question.

Will I really benefit from buying a Trunked Scanner?
I've learned to search "Percon". I've also downloaded
"ScanbaseXE". I've searched both databases for "YF"
frequencies and programmed these into my scanner. I found
only 15 frequencies (and 15 more 'base' frequencies).
I am able to follow most conversations rather well. Given the
limited amount of trunked frequencies, I'm thinking a trunked
scanner is of limited benefit for me. I understand if I
also monitor Indianapolis IN (MUCH larger city) I'd probobly
need a trunked scanner...

thanks in advance.

What is your definition of infinatesimal?????????????

My receiver follows a pass by tuning from about 143.621 to 143.629. I rarely watch the frequency, I am following the deviation meter through the pass and just keep it centered. Doppler effect, basic satellite signal stuff.

> Remember, it's the speed of light that is involved, not sound.

The only difference between the two is frequency ehh?

NOT HARDLY!
Doppler shift on amateur satellites is a well-known phenomena. I suggest
you go to www.amsat.org and learn about it.

Heard the ISS clearly in Northern Ohio on Thursday from 1937-1942 GMT.
I heard two voices, seemingly in conversation with each other, one
signal more distinct than the other. I wouldn't think that I could
hear the ground station from here- is it possible that they were
communicating from module to module over this frequency? Or, perhaps
there was an EVA going on? Since I don't speak Russian, I couldn't
follow the actual conversation. Does anyone know the location of
groundstations in the USA that are authorized to talk to ISS?

It seems like the crew in the station is not using headphones, but a
speaker. The groundstation probably uses headphones.

I don't agree.

The AR 8000 is much better regarding receiving performance.

The AR 8200MKII should be much better than the first series AR 8200.

If you really want to dig in and track it down, you might try 'portmon' from http://www.sysinternals.com -- it does a good job of following and recording all comm activity, and allows you to filter the activity list to make it more readable.

Good luck.

Thomas Edison describes in his patent application for the wireless telegraph in May of 1885 as follows;
For receiving signals I locate in said circuit between condensing surface and the ground a diaphragm sounder which is preferably one of my electro motograph telephone receivers.

The first wireless telegraph picked up the telegraph signals with a loud speaking telephone. De Forest patented his triode in 1907 twenty two years later. For his first radio he used an Edison loud speaking telephone.

Edison's Patent and an essay about wireless transmission can be seen on my site at www.geocities.com/starapex Click on the radio

Where would I be able to download a tracker program for the ISS.

I do not need a tracker that controls the antennas just a real simple tracking program that will tell me when the ISS is coming into range and for how long it will be in range. That kind of thing.

As well I know that you can listen to ISS, I think it is listen only, on 143.625, but are there any other frequencies that are available for communication with them??

Thanx. I am kind of new to the satellite communication thing so I do need a little help sometimes!

All airports of any size now have military aero comm capability.

You can look this up in http://www.airnav.com

255.4 is a pretty common frequency and a good place to start.

See above...

>As well I know that you can listen to ISS, I think it is listen only, on
>143.625, but are there any other frequencies that are available for
>communication with them??

143.625 is the Russian ground control freq. DO NOT TRANSMIT there,
it's not a ham frequency.

"The initial station gear--already aboard the ISS--will be installed
temporarily in the Zarya Functional Cargo Block of the ISS and will
permit operation only on 2 meters--FM voice and packet. Tentative
operating frequencies are: Worldwide downlink for voice and packet,
145.80 MHz; worldwide packet uplink, 145.99 MHz; Region 1 (Europe)
voice uplink: 145.20 MHz; Region 2 and 3 voice uplink, 144.49 MHz. Yet
to be determined is the ARISS operating schedule, which will depend on
the crew's schedules. The ARISS Team eventually anticipates multiband,
multimode operations with the crew and regularly schedule expected to
be very busy with basic housekeeping duties to prepare for their
four-month-long mission, Marchant explained. "The crew has expressed a
high level of interest in beginning Amateur Radio operations early in
the mission," he said. Crew members may use their personal call signs
or one of the "club station" call signs issued for ISS use--NA1SS,
RZ3DZR, or DL0ISS. QSLs and SWL reports will be processed via the ARRL
or Radio Amateurs of Canada. The card design is being finalized, but
it should be ready for distribution early next year.
The Expedition 1 crew will work on UTC, with their day expected to
begin around 0800 UTC and end near 1900 UTC (with a possible "lunch
break" near 1200 UTC). The crew also is off from 1200 UTC on Saturday
until the end of the day on Sunday. "

>Thanx. I am kind of new to the satellite communication thing so I do need a
>little help sometimes!

No problem!

***** If that foreign person *just* has an IDL, you aren't licensed, as far
as
our laws are concerned.***** (Emphasis added by me)

I always figured, myself, that any "driver's license" that was available at any AAA auto club office had to be a little suspect. And the couple of times I had to show a license to a European police officer, he wasn't interested in the IDL, just wanted to see my U.S. state-issued DL. And when I got a Norwegian DL (as a resident alien w/ work permit), all they wanted was a copy of my Okla. DL. They brushed aside my IDL. So I really doubt the tickets issued for "only" carrying a IDL were bad.

Mark

PS You should have seen the look on the Texas State Trooper's face when I showed him my Norwegian DL! I had just flown in from Stavanger, Norway on home leave to visit some family in Dallas, and was on my way to the corporate office in Houston. My Okla. DL had expired the previous month (while I was overseas) so I just pulled out my Norwegian DL. It took him about a half hour on the radio talking to his superior to decide that a US citizen residing overseas who was not part of the U.S. military could have and use a valid DL issued by a Western European country in place of a state-issued DL. Heck, I rented the car at DFW airport using it with no trouble!

I don't agree.

The AR 8000 is much better regarding receiving performance.

The AR 8200MKII should be much better than the first series AR 8200.

(This is a GREAT site, thanks)

I left my RS2006 on last night (143.6250) and was awoken
when my squelch opened up, but there were no voices.

I waited for the ISS to overfly my location today (I used
http://spaceflight.nasa.gov/realdata/tracking/index.html) however,
I never heard it.

Do I select AM, NFM, or WFM? When using WFM I think I heard
a series of squelch breaks which sounded somewhat like a
conversation... speculation is running wild here ;-)

Do I need an antenna besides the standard one?
TIA

If the BC-245 is anything like my BC-235, then the whole processor board is sealed in a chunk of epoxy. It would ;therefore, seem that it is impossible to "unblock" the unit without destroying it. My advice is not to buy it at all and spend your money on a good RS-2006 and an Optotronics control board. Or, get the stock unit and skip the BORING cell phone chit-chat.

From: "M. Schneider" <markinokla@juno.com>
Message-ID: <RxoP5.374$Bi3.1217@newsfeed.slurp.net>
Source record: 76159

I found a mod (at QRZ.com) for the BC-860XLT that is supposed to increase the number of channels from 100 to 200. Has anybody ever tried this and how well did it work? I presume it doubles the number of channels in each bank from 10 to 20. Does the display accurately reflect the channel number? There were no details with the mod, so I have no idea as to what effect this might have on operation.

Thanks,
Mark

When will the galloping paranoids explain just how the US conspirators can
and have influenced the legal system of a competent, sovereign, and
civilized nation such as Canada.

Canada is not a suburb, it is not a legal test bed, it is a fully functional
independent (at times about as independent as a bowl of garlic) nation state
which happens to share part of our political heritage.

If anything, Canada has less restrictive radio laws than the US. Simply
asserting some sort of international conspiracy does not make it fact.

Really????
Try passing off an IDL as your only license in California. If you are a resident of California and have no CDL or a suspended or revoked CDL and you get you car towed and a nice little citation or a trip to jail.
I would be more than happy to debate this one.
Sure an IDL can't be suspended or revoked (no authority) but just let them prove you have lived in CA for more than 10 days and you must get a CDL or Cal ID card.

Honestly now.....
Where do you hear this shit?

The law...not the treaty says you better have a valid DL in your country of orgin for the IDL to be valid. For a US resident an IDL is useless and not honored. I have even seen folks that get a Mexican DL with a phony name get caught. Honestly...if you are in the state computer system than it's pretty easy task to make a ticket stick on this one. They pass IDL out like popcorn at Auto Club offices..
We have impound lots full of stories like this.

San Diego county spent 81 million plus for a digital system. The California Department of Foresrty got the radios and talkgroups also in addition to their VHF radios. So whenever there is a mutual aid callout...the CDF patches the VHF and 800 systems together... even though they are equiped with the new system. Most user care about one thing.
"If I push the button...can I talk?"
Real simple stuff for 81 million dollars.

My guess is that we're hearing a bit of what's in the headphones.
You DO hear one of the other guys in the background though I believe
from time to time. Maybe listening in to what Russian ground control
is saying, you know, being in on what's being said from the ground.

It really depends on traffic in your area and whether other
groups are added to the system. Using a trunked scanner
will allow you to identify and follow a specific group and lock
out groups like DPW or others that may not be of much interest.

DPW = Department of Public Works?

Would these people be considered "YF" Trunked Public Safety ?

2466. PCR-1000 Communications Problem

Newsgroup: rec.radio.scanner
Date: 2000-11-11 05:54:21 UTC
From: cspacone@pacbell.net
Message-ID: <3a0cdde5.3436357@News.pacbell.net>
Source record: 76124

I have a PCR-1000 and am using the software that came with the radio. When scanning from memory lists the unit will stop and display on the window titlebar "Connectio...". At the same time the controls for the radio go dead, the S-meter drops to zero and the scanner needs to be restarted. This is happening at regular 10-12 second intervals.

Clearly something is hitting the com port (com 2) and interrupting communications between the PC and the radio. I had MS ActiveSync 3.0 installed to sync my PDA (on com 1), removed that and have removed or disabled all the software I can think of to stop this annoying behaviour.

Other than that everything works great. Any ideas?

Thanks,

cspacone@pacbell.net

Source record: 76048

That (not gearing a message at all vs. hearing something with static) is not necessarily a *bad* thing. Generally speaking, because of the used of FEC, a digital signal is going to sound good until you hit the "cliff" and it disappears completely (bit error rate is just too high, not enough corection available or the correction also not received). But that is already past the point where analog would have been scratchy, noise, just plain lousy. If you find places it doesn't work at all within your primary coverage area, you've got a system design problem --- it's just physics, how much signal is available --- vs. Money --- how much are we willing to spend to get rid of dead spots (realizing, of course, that we can never get rid of every dead spot).. From the point of view of tactical operations, it may be better to have no communications then to have communications which are so poor as to be easily misunderstood ("shoot" versus "don't shoot!").

Jason--
Yes and no, I have a desktop tuned to the same frequencies which presents no problem. This pro-97 handheld has been driven all over town and receives errant signals, mostly AM radio but some others as well on all 10+ frequencies programmed. Sometimes it will find some low grade noise (humm or buzz) and land on it to effectively stop the scan--squelch all the way up--. I am pretty sure there is a fundamental problem with the radio.

Thanks for your help and input----Bob Martin

Wrong. Our treaties bind the government in its relations with other
nations. They generally have nothing to do with the police power as
exercised upon citizens within the country. If you were correct, there
would be no state driver licenses at all because they would be
unconstitutional. However, that is patently untrue.

States are not obligated to honor federal treaties with foreign nations
because the states are not constitutionally empowered to deal with foreign
nations politically.

You will find no language in the IDL treaty that limits the power of any
signatory nation (or its political subdivisions) to regulate driving within
their borders or to require their citizens to have local licenses. The
United States would not have ratified any such restrictions on its own
sovereignty.

The airlines do, they have loosened regulations concerning devices that can be used in flight. Look at http://www.delta-air.com/travel/trav_serv/bag_info/Portable_Electronics/index.jsp where their regulations in compliance with the FAR allows VHF scanners. The FAR gives authority to the pilot/carrier. Delta DOES allow scanning above 10,000 ft. Maybe you need to go school them? :-)

I've always wondered, if miniscule amount RF being generated by the IF of scanners was such a problem, seems when a plane passes within a few hundred feet of thousands of watts of RF from hundreds of different transmitters on take off and landing they are certainly doomed! Anyone have an explanation for this?

Glenn

Does anyone know how to tell the Pro-94 and Pro-94a apart? Do they have any markings on the outside or is there a certain date code you can go by? I know the main difference between the two units is the original 94 would not scan both the trunked and conventional frequencies at the same time. The A version on the other hand will scan both at the same time.

Thanks, Jon.

I just got back an 895XLT that I dropped rather horribly.

I gave them the instructions "Return to new condition" and then listed everything that did not work, including broken folding leg.

Everything works fine--but they missed the leg. One would think that they would have noticed how lopsided it was on their workbench.

But it's still better than having to throw it away and buy a new one.

Residency came into discussion when you mentioned that IDL's are a free pass to get around suspensions and revocations.

>
>
> Further, would you care to post the section of law you are referring to? I
> tend to think it says something other than what you claim.

I'm just stating what happens here...and it happens all the time in this sleepy little border town called San Diego. Argue it all you want on usenet...try it in front of a judge and they will throw it out. Now if you want to be a test case...fine. Tell me when you will be in court and I will be happy to watch you plead your case. It's not up to me to provide your defense. A quick phone call to the DMV in ANY state should satisfy your hunger for the truth.

Me thinks you have never been thru the hoops on IDL's and you are just blabbing.

Tell me you are not a current US citizen...and I will eat my words in a second...short of that...you are shooting blanks.

Mark

Maybe we have problems with keyloads or just inept operators,'cause they can't make it work right. The system is about 3 years old and I don't know what type of encryption is used...just it don't work.

The San Diego Sheriffs department made privacy the #1 priority of the system...too
bad they left a big backdoor open.....They will deny that project 25 is open ended
because it would expose the real story.

I wonder if/how well it can receive 2.4GHz video transmissions?
Actually, my 2.4GHz video receivers (I have both X10 XCam2's and
another stand-alone video sender) are getting serious interference
(on all channels) from my Siemens 2.4GHz spread spectrum Gigaset
base unit - and I see the Panasonic 2.4GHz is also spread spectrum
so I guess I need to either buy phones in another band or get wired.

Then you have a legal case to sue California. See the US signed the treaty recognizing IDL's and the States are bound to honor the treaties established by the federal government.

Excuse me, but since when did residency come into the discussion?

Further, would you care to post the section of law you are referring to? I tend to think it says something other than what you claim.

Both frequencies are allotted to the Ham Service.
29.64 is commonly use as a FM repeater output, with input being 29.54.
These frequencies make worldwide communications possible.

Cross-posted to: rec.radio.scanner,rec.radio.amateur.space,rec.radio.amateur.misc,alt.ham-radio.vhf-uhf,alt.radio.scanner

On Saturday 11/11 from Northern Ohio, at 1248 GMT I heard an ISS crewman say a few words, then there was a few seconds of dead air, then instant static- sounded like they shut the transmitter off. As they passed over three orbits later, at 1738 GMT, the transmitter was still silent. One orbit after that, at 1913 GMT, I heard the signal come on, a voice said "Hallo- hallo- hallo-" then some ensuing chatter in Russian.

So what was this all about? A sleep period perhaps, or maybe transmitter maintenance?

Just for the record, I track satelites using SatSpy 3.03, I get element sets from the NASA Orbital Information Group at http://oig1.gsfc.nasa.gov/scripts/foxweb.exe/app01? and monitored the frequency on an Alinco DJX10 attached to a mobile mount 2M antenna.

While we're talking about high-tech radio systems, does anyone have any experience with digital radio systems? When I was in Korea, we used one of these and they were great when you were in a good spot - the signal was strong and clear, but if you were in a bad area, there was nothing... at least with a repeater or simplex system, you might get some of the signal in and be able to figure out the message even if there's static in it...

2502. Re: PCR-1000 Communications Problem

Newsgroup: rec.radio.scanner
Date: 2000-11-12 00:00:00 UTC
From: cspacone@pacbell.net
Message-ID: <3a0ec9f8.789357@News.pacbell.net>
Source record: 76192

I think I have narrowed the problem.

Thanks to a suggestion by Clay, I found portmon a program that allows me to look at the command strings going to the radio. I found that on fairly regular (10 to 12 second) intervals the Icom PCR-1000 application sends command G105 which forces the radio to 38400 baud. This has the effect of stopping all activity on the radio until communications is re-established. I ran portmon with TalkPCR and the only time G105 is sent is during initialization.

So the question now is: Is there a firmware problem with the PCR-1000? For example is it supposed to continue as normal after receiving G105 command (not likely). Or is the problem with the Icom application? It is clear to me that the application is sending the set baudrate command G105 at regular intervals. It seems the fix should be fairly trivial.

Could it be that I am the only person who has identified a causal relationship between the Icom app and the radio's behaviour during scanning? In any case I'll be forwarding this to Icom in the hope that they will address what I consider to be a bug that should never have left the developers PC.

Thanks
Chris Spacone

Would it make you happier if he had said "FA: PRO-43 Plus Extras"? If you check the auction, he does include some extra stuff w/ the scanner, but not enough to justify the opening $229 bid (which he hasn't gotten as of yet, heh-heh).

Ha ha ha ha ha !!!!! Got to love it!

>But that's how Motorola pushes it...they sold and entire county on a secret
>system. They have the encryption option...but It's real buggy and sounds even
>worse...so it's not used. As long as *they* think the system is closed...

I've got P25 CAI Astro here. I also use it in DES-OFB and can't tell the difference in audio quality - only a slightly longer delay in recovering the audio. Maybe they had older equipment that needed DVP-XL or DES-XL and had to configure the system to be retrocompatible? THAT stuff sounds nasty.

Motorola pushed going to 800 as being totally secure back in 1980. I vividly remember a salesman poking around one of the towns I volunteered for on an ambulance 20 years ago. It really was private, too. All the cops complained they couldn't hear them on their scanners and I sold a bunch of Hamtronics receiver converters (so much for privacy). Granted, in a metropolitan environment, there are benefits to using 800 MHz. Privacy is not one of them.

Then in 1984 or so, they hyped trunking. Nobody could ever follow your conversation! Right? (take four receivers and tune them to all of the voice channels on a 5 channel system (that's what most public safety had back then) and you heard everything - and then some (so much for privacy). Granted, in an area which is short on spectrum space trunking has many benefits. Privacy is not one of them.

The only privacy is encryption; and while I don't think normal traffic should be encrypted, if a police department can afford to buy MP-5 submachine guns, M-4 rifles and bomb robots, they can afford encryption as a tool for their officers' protection. If a fire department is spending $500,000 on a Super Whizzer combination Do It All truck with an extra $75,000 worth of paint and decals, they can afford a new radio. But, they are putting in a piece-of-sh*t radio they got second-hand in 1972 which was in two prior vehicles. Many departments are taping old MT500s together with Scotch 33 to keep them in service. Then we wonder why no one heard the call for help.

I know of a multiple jurisdiction fire dispatching operation that is going in circles trying to build VHF infrastructure to suit the legacy of glued Maxon, duct-taped Ritron Job Com portables and GE MASTR Exec

mobiles (all in carrier squelch). The stating point was obvious, but a consultant took them by the hand and lead them down the path. The new infrastructure is doomed to failure not because it isn't good or well built, but because the weakest link (what cellular companies call "subscriber units") is either ancient or was inappropriate purchases of light duty business-grade equipment for a harsh environment.

I've been calling for technical proficiency requirements for people who operate public safety communications facilities. There really aren't any such requirements, although organizations like NENA have proficiency certification examinations. While I know many sharp and adept administrators, there are more who are the Sheriff's brother-in-law, rubber gun police officers or rubber nozzle firefighters who are in purgatory until they can retire.

If you don't know what you're looking at, and it looks nifty, chances are you're getting bamboozled.

Steve

Well.. I stopped reading this thread when it got to the US vs Canada bit. I just thought that it was quite resourceful of the little druggies to monitor pager freqs. Haha.. they should have had some sort of warning that would page them when their address comes up on a pager then proceeds to wipe the hard disks, Then they could page their very well trained dog to hide the guns and bury the drugs.
Perfect!
(but just a beeper pager for the dog cause of course he could not read)

I am not familiar with their recon program, But see if this is any help.
Have you tried another radio on the same antenna (if it is a base/mobile) or
(if it is a portable) another radio next to it?
You may have an image, which is a mix of two frequencies creating another.
This would not be an actual problem with the receiver.

There is a live chat for ScanAtlanta going on in the #scanatlanta chatroom on the DALnet servers of IRC tonight. While most of the past participants have been from the Atlanta area, we invite anyone to stop by and chat about our hobby and what you happen to be hearing on your scanner tonight. The is a pretty laid back chat group and we aim to keep it that way so - NO TALK ABOUT POLITICS AND NO FLAMING ALLOWED.

It is Saturday night around 9 Eastern time and there are a couple of us in there for at least a little while, so drop by if you get this soon enough.

2514. Antenna recommendation request

Message-ID: <3A0E3783.DD5E238A@att.com>
Source record: 76173

I've got a RS 2006. I've been using it to listen to
mainly 800Mhz stuff. I've been to Strongsignals.net
and reviewed the antenna recommendations. It appears
they view the RS 20-013 and 20-014 as pretty good.

I intend to mount this in my attic given nieghborhood
bylaws and such.
???
These are not available in my radio shack catalog.
???
A quick review of the RS web site provides me
recommendations for mounting, parts lists, etc.

I assume this antenna has been superceded.

Any recommendations

2515. Bad Uniden Scanner Repair Experience

Newsgroup: rec.radio.scanner
Date: 2000-11-12 04:03:58 UTC
From: Sean <sdf3825@aol.com>
Message-ID: <3A0E16D4.67F571D2@aol.com>
Source record: 76174

I recently sent an out-of-warranty BC890XLT in to Uniden for repair service. The problem was that the squelch was bad, i.e. when you pressed "scan" it would stop on each frequency, regardless of how the squelch sensitivity was adjusted. Also, when I would turn the tuning knob the frequency or channel number would only go *down*, regardless of which way I turned the knob.
Anyway, I sent it to Uniden, along with a check for $61 (including return shipping) and got it back a couple of days ago. I was pleased to see that the problem with the tuning knob had been fixed, but I soon found out there was still a problem with the squelch! Even when the squelch knob was turned to it's least sensitive position (all the way counterclockwise), the thing would still stop on a "dead" frequency every now and then due to white noise making it stop. But at least it wasn't quite as bad as before, when it was stopping on each succesive freq. I wasn't about to go through all of the trouble and hassle of sending it back, so I opened it up myself and made a few adjustments and was finally able to get it where the squelch would trigger properly and I could then actually use the thing (I had to adjust the "SQ" potentiometer to make the squelch trigger right and adjusted L18).
Now the thing is working great (better than when new, I haven't heard any of the god awful UHF TV bleed over that used to drive me crazy). But with that said, I still think it sucks that Uniden sent me back a unit that was repaired and yet was not properly adjusted. It would have just taken a couple of minutes to take care of it while the tech had it opened up, so it looks like they just did a real quick check, declared it to be good, and packed it up. Instead, I had to waste my time opening the thing up to perform the proper adjustments. When you pay $49.99 or whatever it was before taxes to have something professionally repaired, I don't think it's too far out of line to expect the thing to be returned to you repaired and adjusted in proper order. And to top it all off, they didn't even include any documentation regarding the repair or any type of receipt. Oh well, I don't know it this is a typical experience with Uniden, it probably isn't, but I just had to vent.

2516. Re: Police Say Radios Too Low-Tech

Newsgroup: rec.radio.scanner
Date: 2000-11-12 05:23:00 UTC
From: Art Alverez <wilstjb@my-deja.com>
Message-ID: <8ul9fi$6v9$1@nnrp1.deja.com>
Source record: 76175
Cross-posted to: rec.radio.amateur.misc,rec.radio.scanner,alt.radio.scanner,misc.survivalism

I was for many years a communications technician for
a large government agency. It was well understood that
our management would not back us up if lawsuits were
filed against us for aledged communications problems
resulting in some sort of public litigation.
While dispatchers were consistantly named in suits, radio
techs were not (yet). This was probably due ignorance of
radio systems by attorneys. Aside from dead spots, weak
signal conditions, skip and a whole lists of goofy radio problems,
technician induced testing, modification, maintenance and
installation, did and can bring on radio outages that could
become litigious.
Although the idea of technicians being sued was poo-pooed by
many techs, I and others considered the possibily real. Mainly
because of the contrary attitude of management. They didn't tell
the truth.
Most municipalities buy the best communications they can afford.
But in court, that's not enough. The municipality and any workers
involved in a case are liable. I would imagen some government
intities back up their people, but the one I worked for wouldn't.
So I quit, screw 'em.

they do.
what you are seeing is on a secondary image frequency
(some multiplier of the 10.7 Mhz IF and any other signal
sources in the area....

mostly, poor (translate: cheap) radio design leads to this annoying
problem.

1==> Perhaps it is due to the fact that many Americans never travel to
a foreign country and don't realise how useful it can be to have an
IDL?

2==> Probably not as important as it once was, though. These days,
many countries will allow a tourist to drive on a valid foreign
license without the necessity to get an IDL.

In New South Wales, Australia, for example, an American can drive as
long has he has a valid US drivers license. Presumably this applies
to other Australian states also, although I haven't actually checked.

3==> We do drive on the left hand side of the road, though, and the
drivers position on vehicles is on the right hand side.

However, most American tourists seem to have no problem adapting to
this.

Just because the officer made a mistake is no reason to rely on the fallacy that an IDL means anything, without the license backing it up. You can fill up lots of threads in the newsgroups with stories from people who will tell you they "lucked out" when they did not have a license, were too young, were drunk, were on drugs, had a body in the trunk, were driving backwards at 30 mph, whatever.. It doesn't mean a thing, except that police officers have discretion, and often use it. (Of course, I don't advocate discretion when dealing with a body in the trunk!)

There is *no* database the Police Department can check on line if an officer calls in an IDL. It isn't a license, as we covered before, it is just a translation. It has a sequential number on it issued by (of all places) the American Automobile Association in Heathrow, Florida! It is not "on line" in any capacity, so what the officer did on the radio we do not know, but he certainly didn't call in the IDL.

If you've come from overseas and now have a US drivers license (from OK), I find it hard to believe that you "by mistake" handed the officer the IDL rather than your license, when you got pulled over. Shame on the officer for not catching it, but hey, they're human too...

> the IDL has a govt issue ID# kinda like a tax id i think.....

Nope. It's just a sequential number, issued by the AAA.

> and
> my OK driver license has a DL# but not my social on it...

So? You chose not to give a social security number when you got your OK
license...

> ..I hope this helps
> you all out.......and i have used my IDL lots of times for ID....

We're not talking here about what some people will accept as ID. Some people
will also accept library cards as ID.

2523. AMSAT Phase 3D H.F. Launch Nets.

Newsgroup: rec.radio.scanner
Date: 2000-11-13 00:00:00 UTC
From: vlfiscus@mcn.net
Message-ID: <t10ibqp29lrkb7@news.supernews.com>
Source record: 75999
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.scanner,rec.radio.shortwave

The launch is scheduled for 11/15/00 01:07UTC Tuesday evening U.S. time.

The Launch Information Net also will be carried by key HF stations, led by the Goddard Amateur Radio Club's WA3NAN (http://garc.gsfc.nasa.gov/www/retransmission/retrans_status.html). WA3NAN expects to be on the air an hour prior to launch and will re-transmit on its shuttle frequencies, 3.860, 7.185, 14.295, 21.395, and 147.45 MHz. W5RRR at the Johnson Space Center in Texas - or its alternates - will use 3.840, 7.279, and 14.282 MHz.

The Radio Club of Kourou FY5KE also has announced plans to broadcast the Phase 3D launch on 14.315 MHz in French "and probably in English."

2524. Indiana State Police in Fort Wayne

Newsgroup: rec.radio.scanner
Date: 2000-11-13 00:00:00 UTC

Please read the following URLs. The information Reed has supplied is not
correct as far as I'm aware.

143.625 is NOT a beacon frequency. It is the Russian Downlink from ISS to
the Russian Ground Control.

http://ariss.gsfc.nasa.gov/ExpeditionOne/

For Ham Radio Tentative Frequencies are:
Initial operations will only take place on the 2m band.

Here are the tentative frequencies for Expedition One operations: Worldwide
downlink for voice and packet: 145.80
Worldwide packet uplink: 145.99
Region 1 voice uplink: 145.20
Region 2 & 3 voice uplink: 144.49

Reed, please quote your source or correct your comments.

Yes? It says you can use a VHF scanner receivers when you reach altitude.
They don't want you using them when the door closes and the new guy up front
really finds out if his pilots license is any good. If they make it to
altitude without incident the above devices can be used.

>IDL. IDLs are only valid when accompanied by the regularly issued DL.

If you are a California resident, you must show your CDL, but if you're
a visitor, the IDL is ALL you need. The PD can still check you very
closely if they think you are a resident, and they can also give you a
VERY hard time if you're using one of the bogus IDLs you bought on
the Net, but a real IDL is valid and ALL you need if you're not a resident
of the state you're using it in.

Hi- scanner works absolutely like new and is a 10. Cosmetically it has some very light surface scratches bit I would rate in a 9. Buttons are perfect. Used little. Scanner includes the original screw in antenna. Price includes Priority Mail with insurance. I accept Paypal,checks (clear) and money orders. Please email me if you are interested. Please no trades. thanks Bruce

>(except for the Russian thing) ;-)

He is confused between amateur radio and regular operations.

143.625 is the regular downlink (corresponding uplink is 139.208), you
may use it as a beacon when you are in a groundstation coverage area.

145.800 is the amateur radio downlink. Of course you may want to scan
uplinks for curiosity, but it is not really useful.

You are correct for the resident. If one is not a resident, yet
one lives in Kalifornia, one can use an IDL in lieu of the
residential license. The key is in not becoming a licensed
citizen. This is true for any State and is the way foreign
citizens and visitors drive "without a license".

It depends on which data channel is present and stronger. I have a system that shares freqs...both work fine in a 245...just depends on what system it locks on.

i do not know if this will help you all out but....i currently live and reside in Oklahoma City,
I lived in Australia for two years Perth, Western Australia to be exact.....but in 1994 I traveled to Europe for 120 days to travel and work around Europe....now I had to go and get an International Drivers License...for Europe and I drove in Australia on my Oklahoma drivers license...but they did accept my IDL in Australia as well....(i know i had an accident) was hit from behind.....well i moved back to Oklahoma City in 1998 still have my current IDL and that is because i just pay the reinstatement fee every two years......and i got pulled over in Oklahoma City just about eight weeks ago and gave the officer my IDL by mistake and he called it in and i had no problems.....i did not realize what i had done until after he let me go with a warning ticket......but it does not have my social security number on it, nor does my regular driver license for that matter......the IDL has a govt issue ID# kinda like a tax id i think.....and my OK driver license has a DL# but not my social on it.....I hope this helps you all out.....and i have used my IDL lots of times for ID.....

The crew has been granted the entire weekend off. ;-) SO who knows what it might have been. As far as I'm aware they had nothing scheduled with ground control for the whole weekend. I can't remember if they were supposed to have today off too or not...(Monday?)...seems like I heard that...but I don't clearly remember. This was the first long break they've had since arriving on station.

I got this info from watching NasaTV.

I have listened to 143.625 for a week now. That freq is a full duplex downlink. The uplink freq is a different freq and I am not sure what it is(should be 144.95). The chatter I hear sounds like a discussion and not just rag chew. I think its a full time downlink comm freq to their controllers. I hope to hear them talking English to the only American onboard sometime but so far only Russian. I assume the Russians are doing the controlling of the ISS at this point. They use the 143.625 alot and they are on it on every pass over the US so far this week.

You are missing something!

The IDL is not valid without your regular license. You need to have
both with you, you need to show both. So in Calif, you can show your
IDL, but must also show your Calf DL. You can't get by with just the
IDL. IDLs are only valid when accompanied by the regularly issued DL.

Comprende?

2550. AMSAT Phase 3D pre-launch element set.

From: "Kenneth J. Ernandes" <n2wwd@mindspring.com>
Subject: [amsat-bb] Updated Phase 3D Orbital Data Estimates
Date: Sun, 12 Nov 2000 19:52:01 -0500

Below is the estimated State Vector and Keplerian Elements for
the AMSAT Phase 3D spacecraft. The vector data was computed from
Arianespace orbital parameters at the time Phase 3D is scheduled
to separate from the Ariane 5 upper stage. The Keplerian Elements
were computed, in turn, from the vector.

Vector format = 10107
Satellite Name: Phase 3D
Catalog Number: 93400
Epoch MET: 0.02983771991
0/00:42:57.979 MET
EFG E: 4321.19714449 km
F: 10857.07279003 km
G: -1323.50573459 km
Edot: -3.1484853319 km/s
Fdot: 5.7556066452 km/s
Gdot: -0.5488001613 km/s
ndot/2 (drag): 0.00000000771 rev/day^2
nddt/6: 0.00000E+00 rev/day^3
Bstar: 1.25668E-05 1/Earth Radii
Elset #: 1
Rev @ Epoch: 1.52588079822

Launch Window Opens: 2000-NOV-15 / 0107 UTC
Phase 3D separation: Launch + 0042:57.979

The following Keplerian elements were computed from this vector and
the scheduled date and time of the launch window opening. Updated
Keplerian elements will be computed from the vector, based on changes
to the scheduled or actual launch time.

Phase 3D
1 93400U 00320.07636550 .00000001 00000-0 12567-4 0 13
2 93400 6.5034 246.6469 7357988 175.9296 13.3886 2.02435417 17

Satellite: Phase 3D
Catalog number: 93400
Epoch time: 00320.07636550
Element set: 1
Inclination: 6.5034 deg
RA of node: 246.6469 deg

Eccentricity: 0.7357988
Arg of perigee: 175.9296 deg
Mean anomaly: 13.3886 deg
Mean motion: 2.02435417 rev/day
Decay rate: 7.71000e-09 rev/day^2
Epoch rev: 1
Checksum: 283

Note that "93400" is a temporary Catalog Number. A Permanent Catalog Number and International Designator will be assigned when Phase 3D is launched. The satellite name will also be updated with the next sequential "OSCAR" designator.

These Keplerian elements represent a pre-launch estimate of Phase 3D's initial orbit. The orbit will change significantly over the first year the spacecraft is on orbit. Updates will be provided for significant orbital changes.

The Phase 3D launch team will be publishing a similar set of Keplerian elements. The data provided by the launch team will be "osculating" parameters, compatible with AMSAT command station software. The osculating elements are the exact physical representation of the orbit as opposed to the "mean" parameters provided in this bulletin. I provide these mean elements as they are fully compatible with the NORAD SGP4/SDP4 orbit propagation algorithms. Tracking software that uses the NORAD propagators should use the "mean" Keplerian elements provided herein for the most accurate result. Tracking software using non-NORAD orbit propagation methods should use the "osculating" elements provided by the Phase 3D launch team.

[cut]

In the frequency file (stsplus.frq from 11 november 2000) for the
STSPLUS tracking software the uplink fq is stated to be 139,2080 with
the downlink fq 143,6250 for "ISS-VHF1". There are also a number of
other fq:s available for the ISS, but I don't know if they are used at
this time or not.

2561. Cat Scan--BC895XLT interface for Macintosh

Newsgroup: rec.radio.scanner
Date: 2000-11-13 00:00:00 UTC
From: Joe Mastroianni <joe@adaptivesilicon.com>
Message-ID: <8upg0o$nl9@dispatch.concentric.net>
Source record: 76095

Abstract:

Cat Scan is currently Freeware:

Cat Scan is a librarian/ editor and control interface for the Uniden BC895XLT scanner. The interface implements the complete set of front panel controls and display. The librarian/editor allows for convienient on-screen channel editing. Channels may be organized, sorted, and manually moved from bank to bank using the Mac's drag and drop capabilities. Channels, Banks, and entire scanner memory dumps may be written to simple ASCII files for easy transfer and reuse.

Software State: Alpha

Target Hardware: PPC Mac. MacOS 8.5 or greater.

Documentation: Quick Start / User's Guide, Release Notes provided.

Availability: info-mac.org, or via e-mail (no web site yet)

Contact: Joe Mastroianni <joe@killerowls.com> <joe@isthisthingon.com>

Can you elaborate on this? I've heard them once on
143.6250. It was very scratchy but understandable.
(except for the Russian thing) ;-)

Should we scan 144.900 and 145.800 too?

2563. SOCAL; High Desert info?

Does anyone know of any web pages or scanner groups for the high desert area? I'm mostly interested in Hesperia, Victorville, Apple Valley and Phelan. I have the county trunked systems but that's about all. Any public safety that's not on the SB County trunked systems would be great.

Thanks

In article <3A0F2C4D.EFFBE40D@cts.com>, markj@cts.com says...
SNIP!
I applied for an "international" drivers license about 5 years ago, I was to go to europe for several months, but the plan fell through, but, from what I remember:
In order for an "IDL" to be valid it must be used WITH a treaty signitor's (or however you say, a country that has signed and ratified the treaty) OL. For instance, since I was living in the state (or to be exact the Commonwealth of) Kentucky, USA, to have a valid "license" I would have to have both the IDL and a Kentucky Drviers/operators license. The IDL, by itself, granted no driving privalges.
Adn at elase in Kentucky, if the State of Kentucky every "kifted"/revoked yur OL, and, regardless of what other OL you mght use while in Ky, they would treat you like you had no license. I have heard many (and by "many" over 100 in 15+ years of listening to a police scanner), people being stopped for a routine traffic stop and, when they ran the SS they where in very deep doodoo.
OT, the funniest dispatch I ever herad was when the nailed a driver for a "caifornia stop" (failing to come to a complete stop).
They ran his SS and he had a warrent for "felony littering" from West (by God) Virginia. And dispatch lost it. They were laughing so hard they were crying. It took over 5 minutes for them to calm down to where they could be understood. The poor cop, thinking he had a "Very Bad Guy". pulled his gun and made the guy lay on the sidewalk. They decided that since Ky did not have a felony littering statute that they could not hold him. God, I bet he was glad to get out here.

>Please tell me you are joking about this.....oh GOD...you're NOT
>joking....SCARY!!!!!

<cheese eating grin>
I spent nearly two years as the "Director of Technical Services" for the consortium of departments and districts. When I got here, they were using one site to communicate with 660 square miles and frequently had to send engines away from the fire scene to a hill to relay from the scene to dispatch.

I was nearly crucified for suggesting the field user equipment was the majority of the problem, but after installing 6 voting receivers throughout the county and five transmitters for paging volunteers near their homes (instead of 35 miles away), the system was fairly robust - except some units still didn't work and I was forced to install CommSpec boards in many of the radios to put the system in Private Line. It was pathetic to have to re-wrap the radios in tape just to put them together again. No wonder I had such problems!

It's almost five years since I've come out here. Three years after the operation was taken over by the County laying all 17 employees of the consortium off. The equipment is still the same; the system is still running in carrier squelch (and the poor dispatchers can hear traffic from 12 states at any given time) and they hired a consultant at four times what I made to tell them they need a simulcast VHF system (on a channel that is 7.5 kHz below one of the new VHF tactical channels designated by the FCC - I advised them of that and asked, "knowing this do you really want to put more eggs into this basket?" No answer so far... probably won't get one, either.). Do things ever get better? Just to prove that, because of a twist of fate in an intermediate job and no money left to relocate to a large system project that was offered to me in Florida, I now work for the people that laid me off in the takeover. If I only had a crystal ball 5 yrs ago...

Politics is like sausage. It's all right until you know what goes into it. If you see what goes into the sausage, you might not want to eat it anymore.

>The San Diego Sheriffs department made privacy the #1 priority of the system...too
>bad they left a big backdoor open......They will deny that project 25 is open ended
>because it would expose the real story.

I've heard rumors that Uniden will be developing a circuit board for their newest scanner that will decode *unencrypted* Project 25 digital. Like I said, that's not totally bad since I do believe most things should not be encrypted, but someone making the decision to purchase the system should have known that the simple act of being digital is not, in and of itself, good enough to stop a "bad guy" from hearing sensitive traffic!

Steve

> Yes I know that. I've been online for 4 years now. I think I know this.

Hmmm. So rather than spend 15 seconds on a search engine you would rather ask a Ham question on a Scanner group and wait days to see if you get a response. Sorry, you certain could have fooled me as to your 4 years experience.

So asking you why you were limiting yourself to 3 of the 9 HF bands was an asshole question. Oh, okay, that really makes a lot of sense.....

> > Hmmm. So rather than spend 15 seconds on a search engine you would rather
> > ask a Ham question on a Scanner group and wait days to see if you get a

>
> If you don't like it, that's just too bad. A post was made about skip in the HF
> band. I own a RS shortwave and love it. I wanted to know where this HF skip was
> at.

Again, with 4 years experience one would expect to have learned to use the WWW or at least a Ham radio NG for finding ham band information rather than asking on a scanner NG. Again it is your choice if you want to wait hours, days or forever rather than a few keystrokes and 10 seconds for the same information. So after 4 years you haven't learned much. Oh well, its easy to see why.

> >Sorry, you certain could have fooled me as to your 4 years
> > experience.
>
>
> Well, you don't have to be sorry. You can, however, feel sorry for yourself for
> being an asshole.

You were the one being an asshole when I asked you why you limited yourself to 3 of the 9 HF bands. You were the asshole when I made a WWW search suggestion.

This is taking the course of your delusional friend. I tried to help you out, you act like an asshole. Go chase your tail by yourself little mad dog. You are good at that.

Well i just want everyone to know i never claimed to be an attorney...but
it just happened in oklahoma city is all i live and reside in the oklahoma
city metro....(maybe the police officer had been drinking) hahahahaha....i
don't know but i do know he let me go.....so no ticket no trouble.....no how
do they check for a social security number if i do not have one ....because
I got rid of my social security number about two years ago.....i do pay
taxes (what i do not hide overseas) i'm self-employed...and i pay taxes
through a tax number for my small company but i do not pay any FICA or
Medicaid..and very little State or Federal.....before i post this everyone
will say how did i get rid of my social security number???? well a friend of
mine here in Oklahoma city is an Attorney and his little brother is a
CPA....they got ride of their SSN so I just did mine as well....we had to
file in federal court for a revocation of signature....and a refusal of
benefits for future use of any public means assistance.....now that was the
hard part but since i am a minority....1/4 cherokee i can still claim all of
my benefits under the provisions of being native americanonly if i needed to
but i really will never need any help from social security....i'm 28 and
will retire in 15 years when i am 43....my wife is Australian and she does
not quailfy for any public means assistance as well (that is one of the
aggreements for her permenant residencey) since we are self employeed and we
keep about 80% of our money overseas in private non-reporting countries we
get to keep about 92% of what we earn a year....and as long as we always
wire money in to ourselves under $10,000.00 a day....which anything over
that sends off flags in some law enforcement branch....we should be
fine....now the country where our accounts are in requires us to pay 1% of
our account standing a year....example if we had a million dollars we would
have to pay the country 1% or $10,000.00
a year.....just some statistics i found do realize the average american pays
36% of their yearly income in taxes.......
and over all when you add this number with all the other taxes you pay as
well the average american pays 55% of their yearly income in
Taxes.......(and they say shoplifters are criminal)hahahahaha
That's it hope i have been helpful......

Just one more thing sorry forgot to run my spell check and the 36% of yearly income is in income tax and the rest is on other taxes such as sells taxes and basic goods and services taxes.....i got those statistics out of Tycoon magazine last month.....it was in an article called "American Business Bailing out of America"....something else did you all realize that America has lost Intel the computer company.. They have moved all of there business to Costa Rica because they only pay 2% of yearly income in taxes there.....American businesses are being taxed out of there own country!...see ya hope this has been helpful!

You have to understand that the only reason Algore is so desperate to win this particular election is that he's been groomed all of his life to be President, and this is his LAST SHOT. If he loses this one, it's all over for him, and he knows it; he won't be able to run in 2004, as a certain female Senator-elect from New York State will steal the nomination from him without any problem.

Gore said he "needs" to be president more than Bush. Bush already has
a day job. :-)

None of this has anything to do with any of the types of radio in your
"Newsgroups:" header.

Regardless of the outcome, there is no "will of the people" in America.
Roughly half the people couldn't be bothered to vote, and of those who did
the vote is almost evenly split between the two top candidates. We'd all
be much better off if the politicians recognized this.

What I enjoy is looking at my watch every time one of these Democrats comes
out to see if they can go 15 seconds without mentioning the "will of the
people". Al Gore succeeded: He mentioned the word "people" about 15
seconds into his speech, and took another 7 seconds to talk about their
will. Warren Christopher in his speech on Saturday failed: it took him
just 11 seconds before he couldn't stop himself and blurted out "will of
the people!".

I voted Libertarian, so my will clearly isn't being expressed. :-)

As was reported earlier in this thread, there are 400 Mhz trunking systems available, actually installed, and in use. The earliest of these were near the Canadian border, where waivers were available for 400 MHz frequencies. But there are numerous 470 MHz systems out there too. It's just a matter of what frequencies are available--- and like most folks, I'll take 400 MHz over 800 MHz anyday for wide area systems. But it's too easy to say it's all a money play. In certain circumstances, 800 MHZ will work better, (generally, in some urban settings). And because, in a trunked system, a whole lot of profit is in the "subscriber units" --- the portables and mobiles --- it's a lot less headaches for the manufacturer if they have less infrastructure to put in. All other things being equal, (in my humble opinion) a 400 MHz system is more profitable for the vendor than an 800 MHz system.

Gore is a LIAR. Put it this way, Bush is not great for sure but Gore was the VP during these good economic times & any normal person would have walked away with the election that was associated with it & besides he lost his home state which would have given him the election. That should tell us all something.

2588. Pro-92 EDACS question

Newsgroup: rec.radio.scanner
Date: 2000-11-14 00:00:00 UTC
From: DAtkinson@dockpoint.net
Message-ID: <3A11612B.B6735DBC@dockpoint.net>
Source record: 75866

I am programming a Radio Shack PRO-92 trunking scanner for a buddy. I have programmed this one set of channels in the order that they were shown in POLICE CALL. It has found the control channel and it displays the (01-05)-1297, or some such other set of numbers when transmitting. I have five different sets of these numbers(listed below, to the best of my recollection). But the other channels will not track unless I manually put it to that channel. My control channel is on 03(the third channel in line). My other scanner, (a non-trunking PRO-74) listens for traffic on the other four channels.
I have read the manual as well as been to other websites to try and find out EXACTLY where I put these numbers in at. I have had no luck.

-Do I go to each channel and assign I000(in the upper left coner) to the 1297 code? Or the I001 to the 0358 code? And so on.

-Do I match up the numbers that are displayed on the control channel with the frequency of the channel that is transmitting at the time?

01-0358 02-0358 04-0358 05-0358
01-1297 02-1297 04-1297 05-1297
01-0359 02-0359 04-0359 05-0359
01-0382 02-0382 04-0382 05-0382
01-0XXX 02-0XXX 04-0XXX 05-0XXX

Thanks for the help. In advance.
Remove the numbers to reply via E-mail.

Source record: 75871

The PRO-2050 is a great trunk tracking scanner and I like mine.

However, if you want the capability for computer interfacing (i.e. loading memories, backup, control), get the PRO-2052 which is also a great trunk tracking scanner. I certainly like mine.

All depends what you intend to do with it, I guess.

One more post on a "off-topic" that might actually be "on-topic". Let me remind everyone that it was Al's wife Tipper who was trying to censor music several years ago. She wanted congress to pass a law banning certain types of music. Now, I happen to agree that the music being referred to was trash, but I don't think it's too much of a leap from banning certain types of music "for the public good" to banning certain types of radio receivers "for the public good". Ideally, the president would be a Libertarian, as they think the govt. needs to leave people alone instead of passing all these "Thall shalt not" laws, but at least the Republicans are a little better at leaving things alone. (Certain individual congressman are exceptions, I know)

Source record: 75878

I goofed,..I had my Pro-62 connected to my outside CB antenna for reception, anong with the CB. You guessed it, I used a "T" connector, and forgot to disconnect the scanner when I transmitted. Ever since, the scanner doesn't seem to be as sensitive as it once was. MY question is,...I know I may have damaged the front end, and does anyone know if there's any kind of front-end protection I can look for/replace...diode, chip, etc, to restore the sensitivity? I am kowledgeable in electronics, so disassembling/repairing it poses no problem to me...however, before I do so, if I can get any tips, it would help. Thanks.

> manually put it to that channel. My control channel is on 03(the third

If your scanner is programmed correctly, the control channel should show the code "CTR-03" while transmitting the control data signal.

Remember that, when programming EDACS into a PRO-92, the first channel in the system (LCN-1) must be in the second channel in its bank - the one that ends with 01, not 00.

> -Do I match up the numbers that are displayed on the control channel
> with the frequency of the channel that is transmitting at the time?
>
> 01-0358 02-0358 04-0358 05-0358
> 01-1297 02-1297 04-1297 05-1297
> 01-0359 02-0359 04-0359 05-0359
> 01-0382 02-0382 04-0382 05-0382
> 01-0XXX 02-0XXX 04-0XXX 05-0XXX

I don't understand this part of your question. These look like the 4-digit EDACS decimal talkgroup codes, which really have nothing to do with which frequencies belong in what channel location. The PRO-92 doesn't display anything that will help you figure out the LCN, except for telling you the LCN for the currently active control channel.

Source record: 75886

For auction on E-bay (item #498808195)

This is a Realistic PRO-2004 scanner in great cosmetic shape. It does have one problem. After being on for about an hour, it stops scanning and the display goes blank. The display remains lighted, but just goes blank and it stops scanning. Otherwise, it has been well taken care of. I am the only owner and bought this new at Radio Shack when they discontinued this model. They don't make them like this anymore. Rugged all metal cabinet, 300 channels, wide frequency coverage, selectable modes (AM, NFM, WFM), selectable search steps (5kHz, 12.5 kHz, 50 kHz), and much more. Frequency coverage is 25-520 mHz, 760-823.945 mHz, 851-868.945 mHz, and 896-1300 mHz. I have the original owner's manual which will be included. It has some kind of schematic on the last page which may help someone who is handy with radios to fix this unit. I am selling "as is." No warranties are written or implied. I only accept money orders or cashier's checks. It's a heavy item, so please add $10 to the final bid price for packing and shipping. Antenna in photo is included.

OUCH!!!!!

If it's still under warrantee from Radio Shack (not familiar with the PRO-62
so don't know if it's discontinued or not) I'd take it back to them to have
it fixed/replaced. I wouldn't tell them that I transmitted into it though.

I guess you learned an important lesson here, but it bears restating: NEVER
connect two radios to the same antenna in that manner if one of them is a
transceiver. The only way to do that safely is to use a very good filter on
the receiver to block your transmitting frequency. It's also not a good
idea to transmit with an open connection on the T connector.

This will be my last post on this subject so when you get your last word in just know that.

I heard that same quote in my Impala with my shortwave set.. .so does that mean I can cross-post in alt.impala, alt.chevrolet, rec.GM, rec.(fill in the radio blank)?

What a poor excuse! Go to the political arena, man!

Oh, and now that I'm replying about this on my Macintosh, I can cross-post it in rec.Mac, rec.cablemodems, rec.federalwaywashington (where I live), and since I'm wearing Levis while I'm reading about this I can post in rec.fashion.... well you get the idea.

Please, radio topics.

Like I said, my last post on this, I promise.

Check different forums. Anything people do that anyone is doing that a sissybrat might disapprove of as "uncontrolled behavior" is under attack. Dirt bikes, hunting, fishing, Mountain bikes, flying, living or playing on boats, riding horses, etc. I have seen signs that hikers, the allies of the sissybrats in shutting down dirt bikes, atv's, horses, and mountain bikes are now coming under attack to keep them out of wild areas. Of course, you have read of tentative attacks on the internet.

Radio is an uncontrolled means of people talking to each other or getting uncontrolled news from distant areas. This is not permissible. You will be controlled. Resistance is futile. You will be assimulated. (er, sorry, I got a bit carried away.)

You better fight while the battle is in someone elses yard if you want to keep your freedom.

> Actually, I probably know more about the WWW and computers than you do.

Yet you choose to request information from a NG, not even a ham NG. Speaks volumes to what you know. Talk is cheap and so far all you have shown is you can talk.

>Before
> you challenge that, let me tell you why. See, I work on and build
computers.

My first PC was a Compaq 12 MHZ mb open chassis and a 40 MB drive. My first computer was a KIM-I. None of this prepared or trained me to know only an idiot or a newbie would ask for the ham bands on a scanner newsgroup. I don't need to challenge you. Normal life seems to be enough of a challenge for you.

>I
> also hack into them. I also study viruses, trojans and other attacks.

None of that seems to have taught you how to find the ham bands in a few seconds on the WWW. Instead you ask on a public forum and when I question you to help you act like an asshole. Yes your wheels spin real well.

> > You were the one being an asshole when I asked you why you limited yourself

> > suggestion.
>
> Not really. You asked a question and I answered it. If you didn't like my
> answer, well, that's tough shit.

Now now little child. You ask a quesion in a public forum, where topics are posted to encourage discussion. When I offered help you were rude and acted like an ass. Why post questions? What are you doing here in the first place if this is your attitude?

>
> > This is taking the course of your delusional friend. I tried to help you
> > out, you act like an asshole. Go chase your tail by yourself little mad dog.
> > You are good at that.
>
> Hmmmm, I don't have a tail,

Over your head so quickly. I keep forgetting I am dealing with a childs mentality here. Try and think of the act of a dog chasing his tail. Can you picture that or was I going too fast? Your actions are similar to a mad dog chasing his tail. Oh man, I bet you are lost and confused already.

> but since we are now telling people what to do

If you weren't reading on a third grade level you would clearly see I wasn't in the real world sense "telling people what to do". I'll slow it down to your level from here out.

I
characterized
you
as
a
mad
dog
chasing
his
tail
.

Okay, got that so far. Just repl with questions after any of the big words that trip you up. OKAY? Let's continue. I said "Go chase your tail by yourself little mad dog."

It wasn't meant as telling you what to do. Here I slow down again at this hard part.

It
was
an
explanation
of
how
I
was
going
to
treat
your
childish
tantrums
.

Wow, some big words for you there. Just put question marks by any that you don't understand. I'd suggest using a WWW reference source to help with word definitions (meaning of the word) but we have seen your sucess with ham frequencies and the like.

> ....why don't you go fudge packing with Mackey.

OH WOW! How long did you stay up working on that one? Your study of viruses, trojans and other attacks sure has paid off!!! Tell the truth now Did an older fourth grade friend help you on that one or did you copy it off a restroom wall? Is it really YOUR OWN CREATION??????

ROFLMAO

The answer is obvious, yes, that this person is concerned with freedom, not talking heads and campaign slogans. The will of the people has been sidestepped in the US for a long while now, and we are damned tired of it. The clinton/gore administration has been nothing productive, nay, utter sleaze, and I do not refer to billary's choice of concubines (who would waste energy *caring* about that?); I refer to what these "people" have done to our basic premise of FREEDOM, decency, honesty, fairness (yes, I *did* say "premise"). The plain fact is that we have had enough of this ABUSE; we are embarassed, as a nation, and individually. The people we *pay* to govern us have backstabbed us again and again. WE say enough. WE say out with the vermin; as it should be. This is PRECISELY what the 2nd Amendment is in place for, and anyone that wants to circumvent, abuse, and defile the legal statement of our natural rights has no place in a poaitoin of power........PERIOD.
Ah, that sure felt good. :)

Are there any Scanner Sites that are geared toward eastern or
central Pa? Maybe Blair County?

T.I.A.
Rick

Amen! I don't know who in the heck come up with this one thing in one conference were. I had the 3rd BBS in the US and I can assure you it wasn't the pioneers. In no other area of life, in a recreational setting, are we required to keep to a specific line of thought.

If we were subject to an invasion by a foreign nation, would we have to create rec.alt.underattack before we can comment on issues that affect all people in all conferences.

Under normal conditions those that object have a point. With the events that affect our lives unfolding minute by minute, to stick our heads in the sand and claim sanctity of a particular NG is crazy.

> LCN for the currently active control channel.
>
> -Dave, NF2G

01-0358 means that talkgroup 358 is using LCN-1. When a transmission ends, then it moves to the next LCN when the conversation resumes. So 01-0358 mean that talkgroup 358 is using LCN-2, so on and so on.

You will see these numbers displayed when you are manually locked onto the control channel. If you have the correct frequencies programmed into the correct Logical Channel Numbering order, then you will hear radio traffic when you press scan.

Bullshit. Your freedom of speech ends where my rights begin. THAT is what
the founders intended when they wrote the Constitution.

I have a right to expect that rec.RADIO.SCANNER will be about scanner
radios, not the American presidential election recount in Florida.

Some one gave the link to a program called SatScape
i downloaded and installed it and it lists this info for the ISS:
Data for ISS (ZARYA)
(International Space Station)
Beacon: 628.000
Beacon: 632.000
Uplink: 139.208
Uplink: 121.750
Uplink: 231.000
Downlink: 143.625
Downlink: 130.167
Downlink: 247.000
Downlink: 463.000 & 436.000(TV)

Interesting?

Arianespace Flight 135 is Delayed 24 Hours
11/14/00
The launch of Arianespace Flight 135 has been postponed for one day following an
anomaly in the ground-based infrastructure at the Spaceport in French Guiana. This
anomaly, which affected the telemetry link with the PAS-1R satellite, occurred during the
final countdown on Nov. 14.

As a result, Flight 135 has been delayed for 24 hours. The launch window is as follows:

Kourou time: From 10:07 p.m. to 11:03 on November 15
GMT: From 1:07 a.m. to 2:03 a.m. on November 16
Paris time: From 2:07 a.m. to 3:03 a.m. on November 16
Washington, D.C. time: From 8:07 p.m. to 9:03 p.m. on November 15

You have the right to expect anything you wish, but no one else has a
responsibility to see that your expectations are met.

2637. ISS Antenna

Newsgroup: rec.radio.scanner
Date: 2000-11-14 00:00:00 UTC
From: Chris B <cab1971@nospambellsouth.net>
Message-ID: <1ukQ5.7202$On3.22679@news1.mco>
Source record: 75965

Hello all. Wondering for a recommendation for a good antenna to listen to the ISS on. I have a discone mounted outside that so far has provided fairly good reception, but I am looking for something that might pull in the 142-146MHz range even better. Is it worth my while to get something, and if so, suggestions are welcome, or should I just stick with the discone, and maybe mount it a little higher (about 25' high now) for a little improved reception on the lower elevation passes?
TIA
Chris
cab1971@NOSPAMbellsouth.net

2638. Antenna question

Newsgroup: rec.radio.scanner
Date: 2000-11-14 00:00:00 UTC
From: "R.J." <silviaracr@mobile.att.net>
Message-ID: <eflQ5.352$vn5.1305@newsfeed.slurp.net>
Source record: 75966

I know this is probably a stupid question, but I'm going to ask anyway. I have a base scanner, but have no way to put up an antenna, outside, in the attic, or out a window. Right now I'm using a R.S. 20-006 tele antenna. I've tried playing around with the length, but I can't seem to find a happy medium between the 460's and 155's. Half of the problem is it's not very active here, and as I get it "tuned" the transmission drops out. I got it now so the 460's are great but I haven't heard anything in the 155's to check them out. I'm using my Icom IC-R2 as the test scanner as it picks everything up just fine. TIA

> The answer is obvious.

Well, yes, I am. But, more importantly, I'm an American citizen that does not like to see the "Will of the People" thrown around like some kind of campaign slogan. The "true" will of the people rests in the laws of this land. And, according to those laws, Bush is the President Elect of the United States and Gore should start packing his bags to go home.

I'm a little surprised that the two systems would have common frequencies, unless they are not part of the trunk. Some systems have conventional frequencies mixed in, for things such as Mobile Data Terminals. I wouldn't be so much worried about a trunk tracking scanner being able to distinquish between the two systems as I would the controller for the two trunk systems not being able to make that determination. Otherwise, the possibilities for interference are immense.

My suggestion would be to recheck the frequencies and then try to figure out if they are part of the trunk or conventional.

2641. Wanted: Last Version of Freetracker to Replace damaged Version on my fried drive

If anyone has a complete Freetracker version from last May,2000 or
later, please attach it to your email and send it to ricci@mnsi.net so that
I can repair my corrupted files and play with it again. Thanks,
Jack

2642. FS: Yupi MVT-9000 MKII package

Newsgroup: rec.radio.scanner
Date: 2000-11-14 00:00:00 UTC
From: bones boy <stop@look-listen.com>
Message-ID: <r7u31tchvr1gcfd582jhns466a7rkt98pr@4ax.com>
Source record: 75970
Cross-posted to: alt.radio.scanner;,rec.radio.scanner

Hi. It kills me to do this, but I need $$$, so I'm selling my favorite scanner. Here's what you get:

- Yupiteru MVT-9000 MKII (silver, serial # 81200xxx) with all the current modifications (M3.4), discriminator output, RX light on top, and DO cable
- all original accessories (DC power supply, earphone and rechargeable batteries all unused, also whip antenna, hand strap, belt clip and original box)
- all receipts, manual and paperwork from seller
- MVT-9000 leather case
- Your choice of either Watson handheld antenna:
- W-881 (16" ALL BAND RUBBER SUPER GAINER) OR
- W-889 (7" - 16" ALL BAND TELESCOPING LO SWIVEL)
- Radio Shack 3-12V 1000mA AC adapter (works with MVT-9000 on 12V setting)

Price $625. includes Priority Mail shipping and handling and insurance.

I also have a 2/4 way FSK decoder available if you want it (from Texas 2-way) - add $75. to cost of scanner and I'll throw it in.

Would like to accept payment via credit card (PayPal) if possible, money order/cashiers check mailed to me is the only other option. Serious inquiries only. Email me for info, as I can't check here very often. Thanks.

He is concerned about the will of the people because it is the people's votes he has a majority of. Bush does not have a majority of votes, only of the government's electoral people's votes.
Bush does not want the will of the people to matter or he will lose, unless you only count Florida and ignore the rest of the country's votes. Why do you even care? It will make absolutely no difference in our lives if Bush OR Gore is president! Everything will be just the same as it has been under Republican/Democrat rule so far... Higher taxes, more laws taking away our freedoms and rights. If George Washington and Thomas Jefferson were alive today, they would not vote for Bush OR Gore! They would have voted for Harry Browne.

2645. Bearcat 101 Programming Help

Newsgroup: rec.radio.scanner
Date: 2000-11-14 00:00:00 UTC

Cross-posted to: alt.radio.scanner,rec.radio.scanner

I bought a Bearcat 101 off eBay. It got here today and I programmed it with a program I found on the Internet. VHF Lo and UHF bands seem to work fine, but VHF Hi doesn't seem to work. I don't think anything is wrong with the scanner as it wouldn't pick up anything if it is bad. If I try to put it 155.415 MHz, the switches would be 1, 3, 4, 6, 7, 8, 13, 15 UP and the rest down. Is that right? Could there be something wrong with the scanner? Any help will be greatly appreciated.

Not only that but the hand counts were requested in heavily Democratic
counties, one with a 50/1 ratio. Say Bush got 100 votes and Gore got
5000 votes. Say hand counting increases votes by 5%. Bush picks up
5 votes and Gore picks up 250 votes. Does anybody but me smell a rat?

> As to discontinuing the Electoral College ...

Note that we would have exactly the same problem with the popular
vote. Nobody is sure to this day exactly which candidate won the
popular vote because all the popular votes have not been counted.
We may never know because some states have stopped counting.

The systematic error in punch card voting systems is an undercount of
votes. This is understood by anyone familiar with the technology. The
error is when a card does not end up completely punched. In some cases
this is no fault of the voter.

Your assertion that the manual recount would be biased is also
incorrect. The counting is done under the watchfull eyes of both
political parties.

> There will always be a statistical range of random error with any
> measurement technique, and humans are subject to both random and

> abberation would automatically produce a Gore presidency - which is why
> his campaign wants to continue the recounts.

Florida law is clear on the manual recount procedure. A one percent
sample of the county including at least 3 precincts is counted
manually. If the manual sample shows a change large enough to alter
the outcome of the election, the rest of the county is manually
recounted. There is no provision for recounts once the manual count is
complete.

In the Palm Beach case, the one percent sample resulted in a net gain
of 19 votes for Gore. With only 300 votes separating the candidates,
complete manual recount of Palm Beach County could obviously change the
results.

BTW - The transient statistics you are dismissing are called votes.

And who is taking away your right to expect anything? You have the right to expect somebody to knock on your door and give you a check for a million dollars. Doesn't mean it will happen. You also have the right to skip over, not read or killfile posts, posters or subjects you don't want to read.

Article II, Section 2, paragraph 2, (powers of the President, to enter
into Treaties with the approval of 2/3 of the Senate)
and
Article II, Section 2, Paragraph 1 (Judicial power to rule on cases
arising under treaties)

address treaties entered into by the US.

Article I, which lists the powers of the legislature, gives them the
powers to pass laws to enforce such treaties, but does not list the
power to change, alter or ignore them.

Where did you go to school??? What Constitution are you
> looking at...which article??? What country???
> I have smoked a lot of dope...but you must be on acid dude!

No, you apparently just didn't read the US Constitution.

The most likely thing to conclude from this is that the officer was
flustered and didn't know what to do, and neither did his dispatcher that
day.

IOW: You got lucky.

In the funky universe of the fleece-the-patriot lecture circuit, that
may be true. It may even be correct from an academic legal standpoint. You
might even be able to bamboozle your way past a county court judge.

But in the real world, you get arrested and your car goes to the pound
where it gets auctioned next month to someone with a "valid" ID.

> (except for the Russian thing) ;-)

If you monitor 143.625, at least you will know when the bird is
within range. Usually, the beacon frequency will not have voice
on it. The actual frequency that you can expect to hear people
on is 145.800 MHz. The frequency of 144.900 MHz is the frequency
people on the ground use to communicate to the space craft. Not
much sense listening on that one, because you will only hear ground
stations close to your location.

> Should we scan 144.900 and 145.800 too?

No, just 145.800 for the reason I stated above. By the way. I am no
expert, have not talked with the bird, just relaying info that was
told to me.

2684. Trunking Q

Newsgroup: rec.radio.scanner
Date: 2000-11-14 03:07:29 UTC
From: "Frank J. Reda" <frankjreda@home.com>
Message-ID: <R%1Q5.136119$ib7.18413040@news1.rdc1.nj.home.com>
Source record: 76024

I've been using my RS Pro-43 happily for the last 5 years or so. About a year ago, one of the towns I monitor went to a trunked system. I just plugged in all the freqs and manually locked out the control freq each day. It seemed to work well enough, and saved me from having to buy a trunk-tracking scanner.

However, now, the town I live in has also gone to a trunked system, and many of their freqs overlap the adjacent town. My question is this - will a trunk-tracking scanner be able to distinguish between the two towns transmissions on the same freqs? I know the old scanners used to have PL tone capabilities to discriminate between municipalities sharing freqs. Do trunking scanners have this feature (or similar functionality) built in?

Also - any suggestions for a good portable trunk-tracker? I'm considering the BC245XLT...

TIA,
FRank

This is the ground comms, not a beacon.

If they are operating the Ham station. If not you need to listen to 143.625

>The frequency of 144.900 MHz is the frequency

No listen to 145.80 if you feel they are active on the Ham radio station.
Listen to 143.625 if they are woking.

Sorry, no. You must present, WITH your IDL, your valid foreign license.
California requires you to show that foreign license.

From a travel site:

An International Drivers License IS NOT a license to drive a car or any
other vehicle. I can't stress this enough. Any Internet site or email that
tells you differently is either terribly misinformed or is outright lying.

One thing these sites have in common is that they all quote the 1949 United Nations convention that made the International Drivers License accepted in most countries. Talk about twisting words!! An Iinternational Drivers License does not, and was never intended to, replace a regular driver's license issued by the state in which you live.

Which brings us to what an International Drivers License is.

An International Drivers License IS a translation of your current driver's license.

What the United Nations intended with its decision was to make it easier for governments and their agents (i.e. the police) to determine whether a driver's license was authentic and whether it had expired or had any restrictions on it.

Think about it: could you tell an authentic driver's license from France from a forgery? If I handed you my German driver's license, would you be able to tell for sure whether it was real or something I whipped up on my computer in my spare time? (That was a trick question: I have no spare time...)

This is especially tricky with American licenses, since each of the 50 U.S. state has its own, each with a different look and style. How is a police officer in Europe to know whether it is authentic or not?

The International Drivers License provides a translation for your current driver's license and MUST be presented with your current driver's license from the state in which you live. The officer can then use the International Drivers License, which has your picture on it, to refer to your regular license, and can tell the expiration date from your birth date from the license number. It makes life easier for everyone, and trust me -- when you're on vacation you want things to stay easy.

CA Vehicle Code:

12500. (a) No person shall drive a motor vehicle upon a highway, unless the person then holds a valid driver's license issued under this code, except those persons who are expressly exempted under this code.

12502. (a) The following persons may operate a motor vehicle in this state without obtaining a driver's license under this code:
(1) A nonresident over the age of 18 years having in his or her immediate possession a valid driver's license issued by a foreign jurisdiction of which he or she is a resident, except as provided in Section 12505.
(2) A nonresident having in his or her immediate possession a valid driver's license, issued by the Diplomatic Motor Vehicle Office of the Office of Foreign Missions of the United States Department of State, for the type of motor vehicle or combination of vehicles that the person is operating.

That 'valid driver's license' is NOT an IDL, which is not itself a license,
as explained above.

Taking this at face value (I wouldn't want to question the word of another
Okie), I can tell you that, given the current system capabilities of the
OLETS (Oklahoma Law Enforcement Teletype System), a check by name and date
of birth for a current valid Oklahoma driver's license takes , on average,
less than a minute. Checking states other than Oklahoma may take a couple
of minutes. The local dispatchers here enter the information into their
computer terminal as the officer radios it in and by the time the officer
has finished, the response is coming up on the screen. Or the officer in
question can utilize the MDT in his unit and not even have to radio the
dispatcher, the MDTs are tied into the OLETS network.

2693. Gore's "Will of the People" Insult

Newsgroup: rec.radio.scanner
Date: 2000-11-14 07:53:10 UTC
From: Dwight Stewart <stewartx@sccoast.net>
Message-ID: <3A10EF5C.EFA6543@sccoast.net>
Source record: 76033
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,alt.radio.scanner,rec.radio.scanner,talk.politics.guns,misc.survivalism,rec.radio.shortwave

If Gore is so concerned about the "will of the people," the "right" of voters to have their voices heard, or the "accuracy" of the vote, then why isn't he asking for extensions and recounts nation-wide? In other words, why is his "concern" limited to just the voting districts in Florida that might help him win this election?

Because of that, this condescending "will of the people" nonsence by Gore is nothing more than in insult to the American People - the "will of the people" is not a campaign slogan.

Tom, I've listened to shortwave for almost twenty-five years. And, because of that, I know that a person has to be _REAL_ selective not to listen to anything political on a shortwave radio. In fact, the shortwave frequencies are filled with politics in one form or another - the radio programs from almost every country (BBC, VOA, etc) are little more than political propaganda broadcasts. Therefore, it is a little absurd to suggest that shortwave radio has nothing to do with politics, or that politics cannot be discussed in a shortwave radio newsgroup.

Joe Rickershauser wrote:
>
> I heard that Dade is considering
> counting dimpled chads. [snip]

I have a real problem with this. Beyond the fact that it is fundamentally impossible to fugure out the intent of the voter by looking at a card, a dimple on the card especially reveals nothing about the voter's intent. For example, perhaps the voter simply placed the punch tool on the card, started to press down, but then changed his/her mind at the last second and decided to not select either candidate (many people decided not to vote for a candidate). However, if Dade starts counting dimples, that card is going to count as a vote for a particular candidate because there is now a dimple where the tool was placed on the card.

So how does a simple, tiny majority reflect the 'will of the people'.
Taking it as such is just asking for a civil war.

Looking at the map of the US, most of the US is in favor of Bush.
You might argue that the most heavily urbanized areas with the most
people are for Gore, but then simple majority rule (one man, one vote)
was never the founding principle of the United States.

During the writing of the US constitution, many of the smaller states
were concerned that the larger states would ride roughshod over the
interests of the smaller states if voting was strictly according to
population. So the power of the majority was diluted by establishing
the Senate as a second legislative body with equal representation per
state. And since the electoral votes per state are set by the total
number of representatives there is a non-democratic component in the
election process. A candidate must be acceptable to most of the
country not merely the majority.

in the simplest terms, the electoral college covers the widest(cross
section) of american society, not the greatest number of people.

we should consider ourselves lucky that we are not a true democracy. we
are a democratic republic.

if we were a true democracy, urban areas would win all elections, and subsequently likely starve to death, because the rural food growing areas would eventually rebell and withhold food.

Thirty miles is reasonable separation at 800 Mhz. Of course a lot
depends on tower site, ERP, and so on.

If the system is operated by one entity, then I would think that they
are using Smart Zone. That's a bit different than two different
agencies, adjacent to each other, partially sharing frequencies.

Great, now what does this have to do wit hscanners. Unless they vote Mackey on out of there. They should also vote out of office:

Billy Tanzun, and Tom Wheeler.

HEy, no prez, mean less taxes. That is one less government worker.

Three less congressmen/senators if you also read the above and a vote for democracry and no censorship.

Did you hear that the floor is full of chads where they are doing the
hand count? Wonder where all those chads came from? A little slight
of hand with a long fingernail can determine the next president of
the United States.

You could also count on Hillary going to the courts to get an order for the
opposing states to approve her constitutional amendment. After all she
knows what is best for everyone and should be czar.

I'd sure like to see a 'manual recount' of those votes.. But who
controls the machines before and after the election? The predominant
party hacks, I'd guess.

Me too! When there is no "None of the above" choice on the ballot then no
completely clean punch hole means the voter changed their mind and decided
to not vote for anyone for president. This is clearly the obvious intent of
the voter, despite the Democratic assertion that all questionable votes must
go to Gore.

Actually, we do not know this for a fact -- yet. As more absentee ballots are counted, the margin draws closer. Look at the additional states now considering recounts because the margin has become so small. Wait until the final count is in.

As an aside, as it pertains to the total popular vote, did you hear the news report today about the poll of 1000 Wisconsin college students, over 100 of whom voted more than once locally, and over 100 of whom voted by absentee ballots in two states?

David

I don't think so because all the switches will go up and down and act as lockouts when down and scan the channel when up. I wonder if it is off tune maybe and needs and adjustment.

This actually makes more sense to me. It's a win-win for both towns, assuming that coverage is adequate. Your town doesn't have to go to the expense of building the base station infrastructure and tower system. Instead, they can pay the next town over a some sort of "rental fee" for use of the system. They do have to put in a control point at the PD station and buy mobiles and portables. They may also have to put in a couple of satellite reciever sites tied into the main trunking site. The other town gets some revenue to help defray it's costs. With a trunking system, it is only neccesary to program a few more talk groups into the controller and your town has it's own channels. An added benefit is that your town and the next town over can program radios so that there are inter town talk groups for joint operations.

You might want to look at the input frequencies, 45 Mhz up from the base frequencies, to see if your town is licensed for them.

Gary

I appreciate that, but when someone makes a completely off-topic post which
has absolutely nothing to do with radio at all, it's not needed here. Nor
is all the racist garbage which gets posted here. I didn't say that
shortwave radio has nothing to do with politics, it's just that this is a
radio forum & not a political one. I and probably most of the other readers
of this group are here to discuss radio, not politics.

Bush AND Gore should pack their bags and go home!

Why would anyone want another Republican or Democrat as President?! Are our taxes not high enough? Do we really need MORE laws telling us what we can not do and lose more of our few remaining rights? Do we need to piss off a few more countries by dropping bombs on them so that we as citizens have to be afraid to visit any country outside of our own because of "terrorists"? (no one ever bombs a Swiss embassy or airline as they keep their noses out of other countries affairs!)

We have seen over and over what the "Republicats" can do. Enough! There are 46 other 3rd party candidates to choose from! 5 of which are on most state ballots.

RIGHT! and it ALSO wouldn't necessarily mean the the electoral college would pick the candidate everyone voted for!

The US election system is retarded.

At least HALF of the citizens are smart enough to realize this and want nothing to do with it at all.

I had 5 of my radios done by Roberts Scanner Services
(http://home.cfl.rr.com/scan/Services.html), including 3 2006's a 2005
and a 2004. Now they are all readable again!

He did all the radios in a short time, and shipped them back to me in no
time. I was very pleased.

He also makes a keyboard overlay for the 2004 that shows the correct
channel layout for the extra 100 channel mod.

I would certianly reccomend his work!!!

Glad you were able to fix it rather than have to replace the whole scanner.

I don't know why they would place a choke there either, but I don't see how
it could be used as overload protection. Perhaps they were trying to
electrically lengthen the antenna by putting a choke there, if it were in
line with the antenna.

Have you also noted the failure to give us the popular vote count that the Gore people use as proof the American people want Gore. I suspect with the final counts his "popular" lead has diminished a lot.

I checked MSNBC's website and could not find it anywhere.

Actually, a candidate can still win the presidency with only the electoral votes of CA, NY, TX, FL, IL, PA, and MI, and a handful of other "minor" states thrown in. Hardly "most of the country". In fact, had (or is that should?) Al Gore have won (will win) FL, this is precisely what would have (will) happen. The "will of the people" does not matter, nor does some mythical "most of the country". The only thing that counts is electoral votes and the rules set forth by the constitution - something which does not necessarily correlate with either of the aforementioned items. Many people (including you) seem confused about this.

Bush supporters have the same right to request a manual recount. It
might not help them as much, because most of the heavily Republican
counties use a different voting system that is less susceptable to
undercounting votes.

It's not suprising at all and it's common in some areas. Escondido,CA and National City share freqs and both have type 2 Moto systems. They are about 30 miles apart but have no issues with interference anymore. One agency inverts the data stream and the other agency operates in the normal mode. I have to monitor both on a BC245 and I just program one system in. The stronger data channel wins! I get one or the other... Both systems have adjusted power so that they don't overlap under normal conditions.
Another system UC California share channels up and down California with ease. The 245's do a pretty damm good job when 2 systems are present. But I never saw a type 2 system battle an EDACs system on the same freqs.

There are and were several better reasons to keep an electoral system if not a college from which no one seems to graduate.

1. Competitive fraud. Mayor Daley could and probably did steal Illinois for Kennedy. But that is all he could steal. Residents of Wisconsin, et al, could sleep soundly. An electoral system does not penalize those running honest elections.

2. It keeps state and local people in charge of a state and local problem. The alternative is a Federal election police for one, count em, one Federal office. And who watches the watchers?

We have four voting systems in the good old USA.

1. OCR (bubble readers) which work admirably. To the elderly, however, printing them in lite blue in small type is a challenge.
2. Make an X paper ballots, entirely appropriate where there is no need to automate.
3. Voting machines that for a number of reasons are no longer made.
4. Punch cards which work if someone cleans the chat first but are ancient technology prone to stupidity.

If nothing else, we may encourage some better technology and finally wipe out the junk.

Which is why it won't happen. Remember too, any change in
the process MUST be done via a constitutional amendment
which requiresratification by 3/4 of the states. That means it
only takes 13 states to oppose the amendment to block it.
I can pretty much bank on at least that many states that
would oppose any change.

Cheers,
Bill K2UNK

>error is when a card does not end up completely punched. In some cases
>this is no fault of the voter.

It is always the fault of the voter because the voter
should check his/her punched card ballot to be
sure they completely punched the hole. That is in
chapter one of Voting for Dummies.

>Your assertion that the manual recount would be biased is also
>incorrect. The counting is done under the watchfull eyes of both

Which makes no assurances of accuracy...especially after
endless hours of such monotonous activity.

Lack of knowledge ABOUT voting is insufficient cause to
make exception for that person. It should never be the
position of any election review person to have to try
and figure out the intent of the voter.

How often do people completely forget to vote for a
specific position or question until after they left
the polling place. Should those people be allowed
another chance?

Sure they are. Many NJ counties just cutover to fully
electronic machines in the last couple of years.
No levers, just push the button, see an electronic
X appear by the candidtes name and then push a
"completed" button to enter your completed vote.
No paper, no holes to punch, no mechanical levers.

And I would add that radio is quickly becomming the only outlet for conservative views in this country. Democrats control television (80-90% of those who work in television news vote Democrat). There has been an increase in ISP's restricting web sites that contain material that they deem not to be politically correct. Online services like AOL will boot you off in a heartbeat if you make too many waves (offend their liberal customers). So called "hate speech" legislation has only increased the censorship of conservative views even more than it was already censored.

So, in the end, we almost depend on radio to sink or swim. And that includes broadcast radio (SW, etc.) and the public communications radio services.

Exactly how are you going to get the other half of the voters to
the polling places? About 1/4 of the voters are determining who
will be president. Looks like it may actually boil down to a
thousand pregnant chads.

Nonsense. As a scanner owner, I have just as much of a "right" to access rec.radio.scanner as you do, and to post on any subject that I think is relevant to myself as a scanner owner and to other scanner owners. The only "right" you have after that is to simply not read the thread.

In other words, when it comes to a public arena (such as a public newsgroup), your "rights" don't supersede my rights.

While it certainly doesn't have anything to do with radios, it does
have something to do with the "people" who use those radios.

You have just proved by your first statement that the manual recount
would be biased because manual recounts were only requested in highly
Democratic counties. If machine counting undercounts votes and if
the votes are manually recounted only in highly Democratic counties,
of course the manual recounts would be biased.

I think I understand what you're asking, but not entirely sure. I gather
that you're trying to adjust a telescopic whip antenna for performance on
155 MHZ and 460 MHZ. The only thing I can suggest is to find a happy medium
somewhere where both bands come in the best and leave the antenna there.
Trying to adjust the antenna length back & forth would get old very quick.

Alternatively, I'd suggest building a J-pole out of TV twin lead and
mounting it on your wall. May give you a bit more gain over the telescopic
whip.

Thanks for the effort to clarify that, Mark. Let me add that all of us (radio users) are effected, and are going to be effected, by what happens in Washington. All of us have had the government on our backs in one form or another recently. Ham radio users have Riley talking about how free speach does not apply to ham radio. Scanner laws are poping up everywhere. Gun owners have taken a big hit over the last few years. Conservative broadcast programs are slowly disappearing from the shortwave dial. And, if all this nonsense keeps up, we might all become more interested in survivalist skills (insert big smile here).

Even though I'm a Bush supporter at the moment, you won't get any argument with me on that, Steve. Both political parties have some serious damage control work ahead of them. This country is seriously divided and both parties have to address that. If they don't, the "people" will eventually find someone else.

The laws define the way we elect the president - using electoral vote.
And, until those laws change, I suspect the true "will of the people"
rests with the expectation that those laws be obeyed.

I was surprised too. The two towns share a common border.

The freqs are the same - what I can't determine is if they use separate
control channels.

I looked up the license data in Spectrum, and my town is not licensed for
those freqs. It may be possible that they're sharing a system with the
adjacent town, but that sounds odd as well.

> of "interpretating" the ballots that
> were tossed out because of errors.

Two excellent subjects, Curt. As for the hand count, you're right.
It is a subjective process that does not automatically insure a fair and
accurate outcome. In fact, as you pointed out, since it introduces the
possiblity of bias into the count, it actually decreases the chance of
fairness and accuracy.

Furthermore, it is fundamentally impossible to fugure out the intent
of the voter by looking at a card. For example, lets take the partually
punched chad. The fact that is is partually punched does not
automatically mean that the voter intended to vote for that candidate.
Instead, the voter could have started to select a candidate, but changed
his/her mind at the last second and decided to not select either
candidate (many people decided not to vote for a candidate).

> As to discontinuing the Electoral College
> - This would be akin to making the country
> function primarily for the benefit of large
> urban population centers, and would
> disenfranchise less populated (but larger)
> states. [snip]

There is another purpose for the electoral college system - it serves
as a check on the American people. Our forefathers were very careful to
insure that all core aspects of the government are balanced against some
other stabilizing force.

For examples, congress requires a set number of votes to change the
constitution, supreme court justice appointments require appointment by
president and review by congress, the house has the senate, the senate
has the house, the president has congress, and so on. No part of our
government works without some type of check on its power.

To some limited degree, the electoral college system does the same
thing when it comes to the American people's election of a president.
Now, unlike the checks on the other aspects of government, our
forefathers had more faith in the American people, so the check on their

power to elect a president is not so limited. But, our forefathers also insured it was not unlimited either.

Now, whether that was their intent or not is less clear, but that was the result.

Yep, I've noticed. I've also noticed that the press is not covering the demonstrations in Florida as well now that large numbers of Republicans have shown up. And I've also noticed that they are very selective when they pick which messages from their web sites to air on television shows (the Rebublican messages almost never make as strong an argument as messages from Democrats, even though I heard strong arguments almost every day from Republicans). And I also noticed they didn't give Bush the win in New Mexico when he was 50 votes ahead in that state (it was undecided at that point according to them), but they left Gore as the projected winner when he was only 50 votes ahead.

Yep, bias is rampant in the press - they're just too biased to see it, or admit it if they do see it.

We need to take a hint from the malcontent left and start pledging votes
in the next election. Perhaps we can get a Libertarian candidate 5% of
the vote and kiskstart a very old Party.

From: "Ken Ernandes" <n2wwd@mindspring.com>
Date: Tue, 14 Nov 2000 17:33:23 -0500

Below is the estimated State Vector and Keplerian Elements for
the AMSAT Phase 3D spacecraft. The vector data was computed from
Arianespace orbital parameters at the time Phase 3D is scheduled
to separate from the Ariane 5 upper stage. The Keplerian Elements
were computed, in turn, from the vector.

Vector format = 10107
Satellite Name: Phase 3D
Catalog Number: 93400
Epoch MET: 0.02983772000
0/00:42:57.979 MET
EFG E: 4321.19714449000 km
F: 10857.0727900300 km
G: -1323.5057345899 km
Edot: -3.1484853319000 km/s
Fdot: 5.75560664520000 km/s
Gdot: -0.5488001613000 km/s
ndot/2 (drag): 0.00000000771 rev/day^2
nddt/6: 0.00000E+00 rev/day^3
Bstar: 1.25668E-05 1/Earth Radii
Elset #: 1
Rev @ Epoch: 1.52588079822

Launch Window Opens: 2000-NOV-16 / 0107 UTC
Phase 3D separation: Launch + 0042:57.979

The following Keplerian elements were computed from this vector and
the scheduled date and time of the launch window opening. Updated
Keplerian elements will be computed from the vector, based on changes
to the scheduled or actual launch time.

Phase 3D
1 93400U 321.07636550 .00000001 00000-0 12567-4 0 14
2 93400 6.5034 247.6325 7357988 175.9296 13.3886 2.02435417 19

Satellite: Phase 3D
Catalog number: 93400
Epoch time: 321.07636550
Element set: 1
Inclination: 6.5034 deg
RA of node: 247.6325 deg
Eccentricity: 0.7357988

Arg of perigee: 175.9296 deg
Mean anomaly: 13.3886 deg
Mean motion: 2.02435417 rev/day
Decay rate: 7.71000e-09 rev/day^2
Epoch rev: 1
Checksum: 276

Note that "93400" is a temporary Catalog Number. A Permanent Catalog Number and International Designator will be assigned when Phase 3D is launched. The satellite name will also be updated with the next sequential "OSCAR" designator.

These Keplerian elements represent a pre-launch estimate of Phase 3D's initial orbit. The orbit will change significantly over the first year the spacecraft is on orbit. Updates will be provided for significant orbital changes.

Each time the cards are man-handled, flexed, separated, stacked, rubber banded, unrubberbanded, tapped on the table, squared off, more chad conversions occur.
Hanging chad, swinging chad, pregnant chad, and all the other chads are created by handling.
Seems to me, that would render the ballot invalid.
Let em recount all they want, as long as they disqualify those ballots with extra holes punched each time they are recounted. Could possibly get to one remaining stout and sturdy ballot.

>this is no fault of the voter.

I would assert that it is the fault of the voter. My town used those punch cards for years. Never did I fail to check the back of the card before turning it in to see that all the holes were completely clear. I knew that it was important that the holes be free to be counted, and made sure that they were. Actually, they always were, and never needed any help.

>Your assertion that the manual recount would be biased is also
>incorrect. The counting is done under the watchfull eyes of both
>political parties.

I heard that Dade is considering counting dimpled chads. If so, they need to check every ballot, and if they find a dimple in on place, and a complete hole in another, then they must consider that ballot double-voted and eliminate it. It's only fair to be consistant in interpreting dimples.

<<Reposted to new thread by special request>>

Folks,

The biggest problem that I have with the current "hand count" is
that(according to MSNBC this morning) it really comes down to an
exercise of "interpretating" the ballots that were tossed out because of
errors. Since this is a subjective process, its understandable why the
Bush camp is concerned. It's not clear that this would be more "fairand
accurate" than the previously performed machine count (and recount).
There will always be a statistical range of random error with any
measurement technique, and humans are subject to both random and
systematic error (bias). The problem is that if one considered the
undesirable situation of continuous recounting, it's likely that each
candidate would turn up the winner during some percentage of the
recounts. The way things are now, however, a transient statistical
abberation would automatically produce a Gore presidency - which is why
his campaign wants to continue the recounts.

As to discontinuing the Electoral College - This would be akin to making
the country function primarily for the benefit of large urban population
centers, and would disenfranchise less populated (but larger) states.
In that scenario, a presidential candidate would only have to propose
legislation that would benefit perhaps ten major cities in order to win
the office. Rural and suburban concerns would be trampled and ignored
using that model, which is why it's popular with a number of Democrats.
It would be a mistake to think of this country as a single Federal unit
with common goals - there is a reason why it's called the United States,
not the United State.

"John Timm" <John.Timm@worldnet.att.net> stopped in to ask...

> Could someone please point me towards a glossary of common terms used in
> firefighting, especially the various types of alarms that I hear on my
> scanner?

John,

First and foremost, thanks for dropping in at alt.firefighters! It is always humbling to note that people from all walks of life - and all areas, take time to monitor our endeavors. You will also find many like-minded individuals in the following newsgroups:

alt.radio.scanner
rec.radio.scanner

John, were yours an easy question, there would probably be a single web page with *all* the answers. Regretfully, there is little in the way of standardization among US Fire Departments in the "numbering of alarms" (an archaic practice), or the other vernacular that crackles across your scanner radio. While some effort has been taken to standardize major incident communications by use of a Standardized Emergency Management System (SEMS)... an off-shoot of the California-bred Incident Command System (ICS), the breadth and diversity of our nation defies the notion that members of every Fire Department will always speak in universal terms.

Since you are located in Illinois, my directing you to common New Hampshire or Florida terms would be minimally productive - and possibly even detrimental. I will therefore offer you the following suggestions...

Contact your local Fire Department, a fine agency which has been proudly serving the community for more than 100 years:

Grayslake Fire Protection District
160 Hawley Street
Grayslake, IL 60030 USA

Telephone: (847) 223-2120 or (847) 223-8960

Make arrangements to visit the Station and speak with Firefighters or Officers to discuss your interest and support of their agency. If that isn't convenient, my friends at Grayslake FD have a public e-mail address where they warmly welcome public inquiries: firestation@grayslakefire.com . Please tell them I sent you, and offer them my warmest regards!

The Grayslake FD is also the home of Explorer Post #2301. These young men and women not only make it a point to be knowledgeable, but are quite happy

to share what they have learned. If the rank and file of the GFD is not able to assist you when you visit, please don't overlook the enthusiastic and resourceful explorers as a source of information.

While this will help you in your home town, radio signal propagation in the flatlands of Illinois often lends itself to monitoring agencies that are distant. My suggestion there is to network with organized monitoring enthusiast groups in your region. The National Monitoring Association has an Illinois Chapter, which can be accessed via:

http://www.namacentral.org/states/illinois/

You can use that website to contact John Jensen, the IL State Coordinator for NAMA, who can provide local insight.

Also, there are a whole host of "Fire Buff" websites on-line. You can learn about Illinois and places afar by networking among the members of:

http://www.ifba.org

...or via the pages of:

http://www.execpc.com/~vf/

...and finally, you will find some terminology sites on the web, but their applicability to your monitoring is questionable:

http://www.mhc3.org/terms.htm

http://www.airtanker.com/aap/terms.html

http://www.fs.fed.us/r3/fire/swaterms.htm

http://rowings.tripod.com/terms.html

Well, there you have it. Please monitor safely!

Yours in Safety and Service,

Brian Humphrey

>majority.

Since, statistically the rate of error is going to reflect the voting
rate (in other words there will be just as many rejects and
undercounts "for Bush" as there are "for Gore"), it doesn't much
matter in lop-sided races. It only becomes an issue when the race is
so close that a handful of votes can make the difference. Most races,
historically, are not that tightly contested.

>Who knows what the statistical error is in a punch-card
>election? Is it less than the amount needed to invoke an automatic
>recall? If not, we may have had many elections in which vote counts
>or electoral votes awarded did not represent the actual votes cast.

Some group did a study a few years ago indicating that as much as 10%
of the votes in a punch-card system are rejected as errors by the
counting machines. What's really needed here is better technology,
preferably universally applied.

>And then, there's the charges that punched cards from certain
>districts were willfully misplaced. Scary to think that that practice
>may have been going on for a while too. Do we need watchers to watch
>the watchers who watch the votes being counted?

Vote fraud has been common (on all sides) since voting was invented,
and has *always* existed in the US. Again, it generally doesn't make
much difference unless the race is tightly contested, so usually
nobody makes much of it.

-Matt

"At first glance, it may seem odd or even perverse to
suggest that statutory controls on the private ownership
of firearms are irrelevant to the problem of armed crime;
yet that is precisely what the evidence shows.

Armed crime and violent crime generally are products
of ethnic and social factors unrelated to the availability
of a particular type of weapon, and the number of

firearms required to satisfy the crime market is small. Experience shows that these weapons are supplied no matter what controls are instituted and in place at any given time."

Every election has been a farce. And the people who keep saying that
everyone's vote counts are retarded. How can one vote count when
thousands or more are not counted correctly?

How can one vote count when no one has ever won and election by one vote?

How can one vote count when Nader's over 2 MILLION votes don't even get
him ONE electoral college vote?

This will be the 4th time that the people voted for one candidate, and the
government elected another candidate.

Still think your vote counts? Then there is no hope for you!

What good are recounts if they come up different everytime? The fact that no two counts can come up the same means we need to address that concern before we even hold any more elections!

For this time, we need to have every state and city in the country recount all votes over and over and over again until you get at least two consecutive counts that are the same. If you can't do this, then no one can be declared president.

2811. Re: OOOPS! I think I hurt my PRO-62's front end....

Newsgroup: rec.radio.scanner

Source record: 75762

Chokes are frequently used at the antenna input to bleed static electricity generated by wind, rain, or snow from the antenna. Otherwise, the static electricity could build up until it damaged the front end, usually an FET. These are quite sensitive to static. The chokes are carefully chosen not to affect the input impedance, so if you decide to replace it, try to get the exact part. If one cannot be found, try to determine the value of the choke from a schematic, and pay close attention to the physical design of the windings, if you can still tell with the burning and all. The choke may be either solenoidally wound or a pi choke, with several stacked circular basket-weave windings.

Some front-end designs use a transformer coupled input, and are at DC ground. These need no choke for draining of static electricity.

I hope this helps.

Rick

Nice answer. Care to elaborate?

Sasha: a search of Deja News seems to indicate that they've moved to a
system using the RD-LAP protocol, for which there seems to be no
decoding software available to 'civilians'. Yet.

This is an impossible requirement. Every time those cards are counted,
more chads fall out of the holes. You would eventually end up with one
valid card left.

It really makes me wonder why Al Gore, who is ahead in those counties like Palm Beach, is the one here insisting on a hand recount. Don't you think it should rather be the one who is behind in these counties who should be asking for a recount instead ? Common sense, isn't it?

The only logical reason that can be taken from this is that it's easier to increase the lead by manipulating the recount when you are overwhelmingly supported by the counties and their Board of Canvassers.

Something's really fishy about the Democrat's motivations in this process and I hope the American people can see how the system is being fooled, manipulated and abused with the use of legal gobbledygook and rhetorical sleight.

Oh, come on, James. This issue was resolved last week. Buchanan got more votes in those districts because he had more registered voters in those districts. And there is no conflict between the number who registered to vote for Buchanan and the actual number of votes received by Buchanan. Even the Democratic Party recognized this last week and has since dropped that argument. Why do you think you haven't heard it from them recently? The "Buchanan" argument is not valid.

Folks, I was interested in a scanner last year, and then I saw the negative reviews that the Radio shack Pro 91 got. Is it the same as a Uniden BC245XLT?
Anyway, recently a friend told me that one of the Unidens sold at Radio Shack was on sale, and I was wondering what the consensus was. I don't have too many $, but would like to purchase a scanner that would do trunk tracking as well as conventional scanning. The last scanner I owned had 5 crystals in it; you know that's been awhile. Does anyone have any advice for a newbie? What is a good handheld model for someone who doesn't have a whole lot of time to read an encyclopedia-like owner's manual, but has good functionality? It would be nice for my boys and myself to take up scanning as a hobby. Any advice is GREATLY appreciated, please reply to rfdillon@hal-pc.org, Thanks!

And I appreciate that, Tom. However, I don't think it is off-topic.
Again, all aspects of radio in this country is controlled by the
government. Therefore, what happens in that government has, and will
have, a direct effect on radio.

However, you are certainly free to disagree. And you are also free
not to read this thread, or participate in it. But, on the other hand,
don't turn around to complain when we freely choose to participate in
this thread.

Thank you.

Kim, I cross posted this thread to those newsgroups because I'm also involved in those newsgroups. I read each of them at least once a week and post to them when I have the urge.

Since political discussions were already occuring in those newsgroups before I posted this thread, there was no reason for me not to add this thread to that discussion. And, as I have explained elsewhere, I feel the subject is related to radio in general (the FCC is a government agency), it is related to all of the newsgroups listed (even misc.survivalism if this process continues for too long).

Furthermore, AND THE MAIN POINT, if we adopt your suggestion above (deleting newsgroups except for the one you read the message in), how do you know the person you're responding is even going to see your response (he may have posted from one of those other newsgroups).

That's fine, Kim. Then this thread's subject does not relate to you
and you're free to ignore it. Remember, other then how it relates to
your own participation, not everything in these newsgroups must be
weighed against your experiences, or your value of the subject.

And Florida case law confirms any fault lies with the voter and not the
ballot:

Nelson v. Robinson, 301 So. 2d 508, 1974 Fla. App. LEXIS 8601 (1974) [ballot
confusion]

"If a candidate appears on the ballot in such a position that he can be
found by the voters upon a responsible study of the ballot, then such voters
have been afforded a full, free and open opportunity to make their choice
for or against that particular candidate; and the candidate himself has no
constitutional right to a particular spot on the ballot which might make the
voters' choice easier. His constitutional rights in the matter end when his
name is placed on the ballot. Thereafter, the right is in the voters to have
a fair and reasonable opportunity to find it; and as to this, it has been
observed that the constitution intended that a voter search for the name of
the candidate of his choice and to express his choice for that candidate
without regard to others on the ballot. Furthermore, it assumes his ability
to read and his intelligence to indicate his choice with the degree of care
commensurate with the solemnity of the occasion."

This is common case law, makes you wonder why all of Algore's fancy lawyers
and the news media conveniently overlook it...

Hi All,

The ISS heard loud and clear in Boston for about 15 mins beginning 0600 EST on Thursday 11/16 on 143.625Mhz NFM using a BC-760XLT on a roof discone atop the 9-1-1 Center here.

Both Russian and English (American) language heard. The American was discussing informally plans for projects that would be done over the weekend.

Interesting listening!

I did hear them approx 2 hours earlier but it was all Russian at that time.

I was wondering - does anyone know of a scanner that lets you name the fleet ID's rather than going by the number? I have been looking into getting a trunking scanner, but have not seen anything mentioned about naming ID's..

Later..
Greg

Bush realizes that corruption in the hand counting process will cost
him the election. Pregnant chads and dimples count for Gore. See how
easy it is to steal an election if objective ballot counting measures
are thrown away and subjective ballot counting methods are used?

Anyone who knows anything about sampling knows that selective
sampling is invalid.

The best do as the constitution requires. We are not a democracy, rule
by the mob, we are a representative constitutional democracy, rule by
ALL the people, even those who don't vote are expressing their "vote" as
negative.

> The US election system is retarded.

It's so advanced you don't understand it, and probably won't. Tell me
you know how and why it is the way it is.

> At least HALF of the citizens are smart enough to realize this and want nothing to do
> with it at all.

Citation please. Those that don't vote express their negative vote on
issues and candidates. I prefer it to living in a country where one is
required to vote, sometimes at the point of a gun.

d'geezer

Source record: 75836

Hi Greg.

The Radio Shack Pro-2067 has that capability. The display
allows for naming the bank on one line, and then the
individual channel or truck code ID on the next line.

It is a wonderful little scanner in several ways, but very
frustrating in others.

Good: 1. small in size but with many features
2. good sensitivity
3. good adjacent channel rejection
4. good intermod rejection
5. good audio with plenty of power
6. holds 500 channels in 10 banks
7. will scan multiple trunk systems simultaneously
8. will scan trucked and conventional simultaneously
9. will scan all trunking protocols (moto, erickson,
johnson, etc)
10. will scan 400mHz trunking for gov't systems
11. decodes and displays PL and DPL codes per channel
12. can be set to only stop on a channel if that
PL or DPL is present

Bad: 1. will not let you subgroup talk groups into a
"bank withing a bank" In other words you can
not put all of a systems Fire Dept channels
into, say subbank 5 of bank 1, which would
allow you to quickly lock out all other channels
within that system if a major fire was working.
2. not a user-friendly scanner. To add or modify
or delete a channel or PL or talk group is a
major ordeal of navigating menus and pushing
buttons in a very non-intuitive order.
3. without a doubt... THE most confusing owners manual
I have ever read. I have been involved in scanning
since Bearcat made the first scanner back in the
sixties, and I work in electronics, so I am pretty
good at understanding gear and directions. But every
time I want to do ANYTHING with this unit, I have to
go back to the manual and spend 10 minutes trying
FIND the relevant paragraph, and then another 5 or 10
trying to figure out the convoluted directions.
4. a small point, but it is made for mobile use, so that
to use it at home you need a wall wart adapter, and

some way to prop it up so that the bottom mounted
speaker isn't firing into the desktop. There is an
external spkr jack with plenty of good powerful audio.

Longer answer than you asked for, but I do love to ramble on...

Best regards,

David Patterson

Hi, Tom. Thanks for the reply. I found a choke, L-101 at the ant
conn. that was burned. I de-soldered it from the board,...and wahoo!
the reception was restored. Evidently, that was put there for
over-load protection, because it was located so close to the ant, I
see no other purpose other than protection. I have a TS-830-S here
also, and am glad *it* wasn't Xmitting thru the scanner!!! It would
have been fried! I don't use the CB that much, thats why it was

easy to forget. I am usually on 15/20M CW, or Phone.

Take Care, Robert N3DRW

2006 scanner backlight isn't too bright and am wondering if anyone can point the way to a person who might fix these things? Scanner is practically new looking. I am no handyman and would prefer to leave it to someone who knows what they are doing. I don't want to go to Rat Shack because it is modded. thanks Bruce

I see this quite often... There's a common misconception that if it isn't printed, it doesn't exist. There are ALWAYS modifications. Some more difficult than others. You can easily add a computer interface to this, and many other scanners, for $35.00. You can then program the memory channels and operate the scanner via your computer:

http://www.qsl.net/ka2pyj/index.html
http://home.cfl.rr.com/scan/PROgramit/PROgramit.html

Tapping a discriminator is not illegal. In fact, some high end scanners come with baseband audio output. Even the decoders are legal:

http://www.texas2way.com/ddmp.html

Here's where it gets tricky. What you do with your tapped discriminator and decoder can quickly get you into trouble. You are only authorized to decode signals intended for you to monitor (primarily HAM). Read MT's comments regarding the law at this link:

http://grove-ent.com/LLawbook.html#Comment

Have fun,

Robert

Not keen on selling mine but here's another mod available
if you find one:

http://home.cfl.rr.com/scan/PRO34.html

I have also swapped the crystal resonator from 2 MHz to10 MHz.
MUCH faster and I haven't found that it skips weaker signals.

Great radio!

Robert

/Yea, but you have to be able to read to understand chapter one, seems that there are a number of voters in Florida who can't. You can bet that if at anytime during this recount the votes swing in favor of Gore, the democrats will suddenly decide that there is no need to continue any recounting.

Great points, Dwight. There is, of course, a silver lining in this cloud: If Mr. Bush does a credible job, if he is able to build a coalition (as his father was, of fond recent memory), then we can expect great things from the broader (non - partisan) Conservative movement in America. I am, however, a real pessimist (and my opinion is somewhat bolstered by Gore's attempted dirty tricks), and I have a strong feeling that the Liberals will do everything they can to obstruct progress. I am uncertain as to the extent of their success, because of the Republican majorities in both the House and Senate.

73s!

You have a valid complaint. However the title of this thread is
definitely completely political in nature, and the one of the beauties
of Usenet is that you can completely ignore such threads (or people)
that you don't wish to read. So just ignore them and enjoy the threads
that do discuss radio...

BTW did you know that you (and I) are cross posting to guns and
survival groups? I'll bet they don't want to talk about your radios...

I think the choke was wired from antenna to ground; that's why it
received such a load when the transmitter blast hit it, and why the
unit works with the choke removed. I'm not an EE, but wouldn't a
choke in such a configuration act as a bandpass filter to attenuate a
certain range of frequencies arriving at the antenna?

Lets hope so. Our prosperity in the last 8 years was caused largely by
the deadlock in Congress. The Democrats couldn't get their high dollar
welfare agenda passed, and the Republicans couldn't break us with
excess military spending. The stock market loved it. Look for
continued prosperity no matter which President we have. This is one
place where we *don't* want them to all get along...

I think what's most interesting about this election crisis is that it's exposing errors in the vote-counting process that have always been there, but which are normally swept under the rug and ignored, or never brought to light, when one candidate has a clear electoral vote majority. Who knows what the statistical error is in a punch-card election? Is it less than the amount needed to invoke an automatic recall? If not, we may have had many elections in which vote counts or electoral votes awarded did not represent the actual votes cast.

And then, there's the charges that punched cards from certain districts were willfully misplaced. Scary to think that that practice may have been going on for a while too. Do we need watchers to watch the watchers who watch the votes being counted?

I've started using RecAll to catch whatever I can. That's a voice-activated recording program for Windows. I leave the scanner on, set to 143.625, connected to the PC, with RecAll running. One hint, though -- disable the power down mode of your PC. I discovered that the sound card powers down, too, and nothing gets recorded. Duh.

Question for those who know: If I'm using a stock scanner, with either the rubber duck or a extendable antenna, am I better to place the antenna horizontally so it receives from "up there"? I'm thinking I should lay it along a north/south axis, so it will receive from the east to west horizon. Thoughts?

Gerry

Yesterday I heard Shep talking to a female in MC for about 2 minutes
then the Russians continued their qso. I get the station full scale
here for a good part of the pass and maybe half scale near the start
and ending. I currently use a Ringo ranger at 27 feet but will be
getting a Diamond x510 very shortly.

And don't forget about the Democrat county official who was caught with a voting machine in his private possession. At first he denied that he had it, then under questioning from the police finally admitted that it was in the trunk of his car. The police said there were no ballots found with the machine, my question is this:

The only use for a voting machine is to mark ballots, if there were no ballots found with the machine, where did they go? Most likely, they were already turned in at a friendly Democratic voting place during the election, or else they have been distributed to the various Democratic canvassers to add into all of the manual recounts...

And where is all of the news media concerning this, why is there no coverage of this incident, and where is the outcry for an investigation into this obvious attempt to help steal the election ?

RJ,

Tom's suggestion of building a J-Pole antenna is excellent advice, and
you can find many examples and plans on how to do this (and tune it) on the
web. The 300 ohm suggestion is simple, inexpensive and works well.

Our county has a centralized dispatch for all agencies, with repeater towers set up around the county. It is not trunked. What I don't understand is how the radios seems to jump around between frequencies without missing anything. For example mobile Cop A may call dispatch on 460.15 and dispatch will immediately reply on 460.10, then Cop A may respond and be on 460.10 - and there is no time for any frequencies to be manually changed. It almost seems like these radios operate like limited scanners. There are many different agency frequency frequencies in the county and they all talk with the dispatcher on their frequency and no calls are missed and there is no fumbling around with manually switching frequencies. Do these non-trunked dispatch stations typically have several transceivers, one for each agency? Or do they have some kind of automatic scanning capability? For example I have heard the sheriff's mobile units talking with dispatch and then IMMEDIATELY heard another agency on another frequency speak with the same dispatcher. Very mysterious - possibly magic.

Clueless Bob

If they voted for Gore, they DID vote for the wrong guy. :-) Just had
to say it.
I wonder why it is that these people didn't even realize they had voted
incorrectly until after they got home. I'd call these people unreliable
sources. No one can ever know how they actually marked their ballots.
Last I heard, there were 5000 signed affidavits of people who claim to
have accidentally voted for Buchanan in Palm Beach. Buchanan's Palm
Beach fund raiser had 1000 people in attendance.

The 200 XLT has a problem, it blows a Surface mount transistor, Q201. Something has to blow to blow it, usually a capacitor. If this blows, the scanner noramlly works, but it has no audio and no display backlight. My Bearcat is the same at the moment. I'll post the full information and I'll let you know how I get on with mine.

I know of a case where IC4 went bad and took out Q201. Look for R49
being burned also. Check for 16 volts at pin 1 of IC4. If the voltage
is well below 16V the PLL will not work. IC4 is a type IR3M03AN made by
Sharp. Motorola MC34063P is listed as a substitute.

I don't know about other agencies, but we use seperate transceivers in
dispatch for each radio channel we use. That allows us to have simultaneous
reception on several different channels, as opposed to having to change the
channel to talk to fire, point-to-point, etc. I'm sure most agencies are
set up this way. I don't know about them using 460.1 and 460.15
interchangeably, unless one of them is their Tac 1 and the other is thier
Tac 2 channel, and the officer switched over from one to the other.

In our department, we often communicate with our county sheriff's office by
listening to them on their frequency, and they listen to us on ours.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

You can query FCC databases directly from this web page: http://www.fcc.gov/searchtools.html

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://w5gb.nmsu.edu/kc5kto/,
http://www.fordyce.org/scanning/, and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'.

(See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of

information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army

Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each

equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

Uniden sells refurbished scanners dn you can check current inventory at their web site:
http://www.uniden.com/docs/store

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120
Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the ICOM IC-R2, Uniden/Bearcat BC3000XLT, and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 2000 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229, email: electra@tcon.net,

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor

controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2042 and PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published on the CARMA email list, carma@qth.net. You can obtain a free electronic subscription to the CARMA email list. For more info, see:

http://www.qth.net

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Most meetings are be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 2000 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable

Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod,
(comparison intermod performance of several models)
May 2000 - Radio Shack PRO-94 portable
Jun 2000 - Radio Shack PRO-2052 trunk tracking base scanner
Jul 2000 - Electra Tiger Scan TSA portable
Aug 2000 - Phone patches; Identifying scanner crystals
Sep 2000 - Radio Shack PRO-2067 trunk tracking mobile scanner
Oct 2000 - ICOM IC-R3 portable wide band scanner
Nov 2000 - AOR AR3000A wide band receiver
Dec 2000 - Alinco DJ-X2T portable scanner |

Note: Reprints of Monitoring Times articles are available
for $3.00 each plus a self-addressed stamped envelope from
Grove Enterprises, 7540 Highway 64 West, Brasstown, NC
28902, tel. (800)438-8155. I don't receive any part of this
reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back.
Multimode frequency coverage 0.1 to 2000 MHz (minus cellular
bands). 20 selectable step sizes from 0.05 to 500 kHz.
Knob atop the radio clicks when rotated and serves as a VFO
knob, channel selector, and menu navigation control.
Several battery pack options for NiCd and alkaline battery
cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack
and a sturdy 11 hour drop in charging stand. Loaded with
firmware features and complicated to use. Two VFOs and 1200

channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult

user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel

can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2

VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents

4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage

to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are

backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test

unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR

scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be

programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image

rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The

Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per

channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date.

Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search.

No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. For a service manual, call SONY at (800)488-7669, and press 3. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you

find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes

FR2526 10 X X yes yes
FR2527 10 X X yes yes
FR2528 10 X X yes yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and

wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

That would depend on how much current is being drawn- and that will depend further on how high the volume is. If this voltage is critical, you had better use a regulator.

Dan K Nelson (w6dkn@qsl.net) wrote:

: And Florida case law confirms any fault lies with the voter and not the
: ballot:

Yep, Palm Beach people are out of luck. They dropped the ballot in the box.... they voted! TS if they "think" they voted for the wrong guy (even though Buchanan got a much higher percentage in that county than any where else if Fl.)

[snip]

: This is common case law, makes you wonder why all of Algore's fancy lawyers
: and the news media conveniently overlook it...

: 73 de W6DKN

When they know error of the voting counting machines etc is 3 to 5% and the vote difference is <1% .... you got a big problem.

In Fla, when the difference is <.5 of 1 percent (if I remember correctly) a *machine* recount is done automatically. The machine recounts are NOT (and have NOT been) exact and always the same due to chad and other problems.

The state law ALSO allows candidates to ask for a HAND recount (within 72 hours of the closing of the polls). Gore's guys did it... Bush's guys didn't. And Bush's guys have been crying foul ever since. TS (same as those dumb voters)!

****
Think people.... out of ~ 6 MILLION votes cast there is a difference of 300 votes. If you were Gore's people, wouldn't YOU want the best count of those votes you could get?
****

If Bush was 300 votes behind, HE would want a hand count too. If he/they were smart enough to read Fla law and notice that they could have asked for it within 72 hours.

.....
What they should do is split the electorial votes according to the popular votes cast and let it go at that.
.....

Source record: 75787

As much of the full story that I could find has been posted at this link:

http://home.cfl.rr.com/scan/Books.html

(obviously I haven't updated the page about Bill's passing but
the legal aggravation before his death was a major issue people should
be aware of)

"The Cheeks' arrest this spring came after undercover New York cops
contacted the couple in late 1998 and early 1999 and bought five
do-it-yourself kits over the Internet. Once assembled, the units allowed
users to unscramble the encoded messages that pass between mainframe
computers at police and fire departments and those onboard computers, or
mobile data terminals (MDT), inside police cars.

U.S. law enforcement began moving their communications to MDT back in the
1980s, in an effort to put information about surveillance, ongoing
investigations, and other sensitive matters out of earshot of eavesdropping
criminals.

...The charges against Cindy have been dropped."

I believe what really got Bill in trouble was he specifically advertised
on his website everything that his decoders were capable of decoding.
Specifically FAX, Pagers, AND MDT's. These are signals not intended
for the general public to listen to. They don't have to be encrypted to
make
them illegal to listen to, just as listening to cordless phones and cellular
is now illegal. Bill's advertisement left little question as to what his
product was primarily designed to do. This is why others still sell the
same decoders legally today. They don't advertise the illegal possible use.
A subtle, but very important difference. The key phrase to look for
in the ECPA is "primarily useful".

For a good interpretation of what's legal to listen to these days, follow
this link:

http://grove-ent.com/LLawbook.html#Comment

ISS certainly did flyover the NE USA at that time. According to my
tracking data, you should have acquired the signal at about 0600.45
and lost it at about 0608.30. At 0615 ISS was crossing the coast of
NW Spain, a position normally unreadable from North America. Perhaps
your extra 7 minutes of reception was due to your antenna placement?

At 1738 UCT today (1238EST 001116) I heard them surprisingly well,
despite their orbital track being off somewhat to the southwest of
here. For two minutes the signal was clear enough to hear background
conversation, equipment noise, and assorted thumps and clunks.
Certainly the clearest I've heard them to date. No English, though.

Wow Brian you really have to sleep at night! LOL... that truly was a wealth of information.. I like the part about stopping in to the FD people do it from time to time here. but not often enough and never when you really want them to (FD planning needs public support) . they always seem to stop by to chat when your in the can, or want to be..

no matter how much you shake and you dance those last few drops seem to fall in your pants.. need a washer/dryer?

A quote from Mr. Maytag

Andy,

Datapoint:
I live in Indianapolis IN. I did received the ISS on 143.625 as it
overflew the USA at ~noon/18NOV. The closest point was AZ=228, EL=21,
Range=~900Km. This peak location was about New Orleans, LA.

I use a RS2006, with a RS 20-043 discone antenna located "inside at
ground level". For the record, in the past, I have heard the ISS
using the stock antenna. However, I did NOT know the relative
location/distance at that time.

Good Luck.

Bunch of them along Nathan Road, but make sure you know what the
prices are at home first. Often these guys are no bargain. If you want
deals, you need to get away from the Tourist part of town and show
where the locals go. If the merchandise has price tags that you can
read (as opposed to coded), you are out of the tourist parts of town.

For Sale:

Realistic Pro 2042 base 1000 channel scanner. European version with full
800mhz.
Like new condition, boxed and packaged as new with original
box, manual, and antennae. $350.00

Realistic Pro 2045 200 channel base scanner. All kinds of bells
and whistles on this one. European version with full 800mhz.
Like new condition, boxed and packaged as new with original
box, and manual. Still has plastic on display. $300.00

Here is a link to Radio Shack support:
http://www.radioshack.com/ProdSupport/ProductSupportDrillDown.asp?OID=RSSupport-Communicat
ions#

From here you can check out all scanner specs including the above two.
They are the same as the European versions I am selling with the
exception of
the frequency coverage and the power requirements.

Email me for more details or questions and access to my ebay feedback.
I have an excellent rating. I will pay the shipping for the 48 State
area.

Thanks,
Rick B.

I don't think anyone would argue that the built in speaker
for the Icom R75 is less than perfect. My question is this...

What do you use besides the internal speaker.

I am tempted to plunge another $99 (for the SP-21)
or possibly another $220 (for the SP-20). Has any
one tried these external speakers, and if so, how do
they sound and how do they look next to the R-75.

Thanks
Bill
Farmington, CT.

I have an R-75 and was also less than satisfied with the radios internal speaker. I bought the Icom SP-21 and am very pleased with the audio quality improvement. I think you will be very satisfied with the SP-21. The SP-21 is a close match and is only slightly higher than the R-75 when the bails are extended.

2943. A little help with...

Newsgroup: rec.radio.scanner
Date: 2000-11-18 00:00:00 UTC
From: jroulier@[nospam]
Message-ID: <3a170e98.21541093@news-server>
Source record: 75610

a few questions. First, how far can a typical hand held receive frequencies using RS telescoping antenna? I ask because I live in a semi busy city, but Albany, N.Y. is about 20-30 miles away, and listening to them would be nice. I have a 9000, pro-26, Sony wavehawk, and a 3300. I'd need a trunktracker for Albany, but I don't want to buy one if 30 miles is too far.

Second, what is Duplex mode used for with the 9000?

Third, what is that Morse code sounding like stuff sometimes on police channels such as 155.640

Thank you.

2944. Saturday Live Scanner Radio Chat

Newsgroup: rec.radio.scanner
Date: 2000-11-18 00:00:00 UTC
From: - <psleprob@hotmail.com>
Message-ID: <3A17158B.4FC4F1ED@hotmail.com>
Source record: 75611

There will be a live chat going on in the #scanatlanta chatroom on the DALnet servers of IRC tonight starting a little after 9 p.m. EASTERN time. While most of the past participants have been from the Atlanta area, we invite anyone to stop by and chat about our hobby and what you happen to be hearing on your scanner tonight.
The is a pretty laid back chat group and we aim to keep it that way. THIS CHATROOM IS NOT A PLACE TO CONDUCT FLAME WARS, DISCUSS POLITICS, OR CARRY ON ANY OF THE OTHER USELESS CRAP LIKE HAS BEEn SEEN IN THE "USENET" NEWSGROUPS. If you can't be fun and sociable, please stay away.

For those of you who aren't familiar with connecting to chat groups, some info. is posted at the end of this message that should help anyone with a basic knowledge of computers to get started.

Hope you have a chance to drop by!

Use an IRC (internet relay chat) chat program such as mIRC, pIRCh, etc., to access the ScanAtlanta chatroom. You download the mIRC program for FREE at http://www.mirc.com/. There are lots of FAQs covering IRC chat in general on this site. Since that website gives a good overview of IRC, I will not try to duplicate it here. Basically, "IRC chat" is a way to chat "live" with people around the world.

IRC software packages are available for most any computer running Windows 3.1/95/98 and Mac. These programs are not hard to setup and run for most people but everyone's computer is unique and thus could have conflicts of some sort. We have tried the Java based chat software programs, but they were very slow/cumbersome. Since we did not get a good response from new members toward the Java programs, we went back to IRC based chat.

Once you download the mIRC software and install it, follow the setup directions as prompted by the software (put in fake stuff for your real name and email address!!) and pick a nickname for yourself. Then once you are_already_online to your ISP, you click the second icon from the left ("options") on the icon bar found near the top of your screen. A popup window will appear. WE HAVE SWITCHED TO THE "DALNET" SERVERS BECAUSE OF THE HIGHER PARTICIPATION RATE AND APPARENT EASE OF USE FOR SOME VISITORS AS COMPARED TO THE PAST SERVERS. Go to the second drop down box which lists the different servers available, scroll down this list until you get to the section that starts out with "DALnet" server names, click on one of them (I usually try the one in Ohio or New York, but you can try any_one_in the US). Then click on "connect," NOT the

"OK" button. It will take a while to connect and get you going. Click on the "Status" box to watch your computer and the server "do a dance" and connect. This little dance can take a while to complete. Additionally, you may get a "can't connect" or "server full" error which means you must try another server. To do this, you again click on the second icon from the left ("options") on the icon bar near the top of your screen and choose a new server (follow the directions as above).

Once things come up on the screen, click on the "channels" icon (third from the left). Type in #scanatlanta in the top box/entry field, then click on "join" - NOT "OK "or "close" buttons.

If you are successful, you should see a new window open and you will find yourself in the chat room. On the right side, you will find a listing of those who are in this chatroom. Be warned though, some of these nicknames may be for "bots" while others could be for live people in the chatroom. Just type in "hi" (and hit return). Somebody should answer you. NOTE: Often people will go away from their computers for a few minutes to do other things, so stick around for a few minutes if you don't get an answer right away.

The chatroom is open for anybody to use 24 hours a day, 7 days a week, but as of late, about the only time you will find anybody "alive" in there is on Friday or Saturday nights. If anybody actually shows up on these nights, they usually come in around 9-10pm Eastern and most usually leave around midnight (depends on how interesting the airwaves are that night). If nobody seems to be "alive" in the chatroom, post a message to the ScanAtlanta list and invite people to join you in the chatroom.

This chatroom is a place for people to come have fun discussing scanners in general and what they are currently hearing on the airwaves. THIS CHATROOM IS NOT A PLACE TO CONDUCT FLAME WARS, DISCUSS POLITICS, OR CARRY ON ANY OF THE OTHER USELESS CRAP LIKE HAS BEEN SEEN IN THE "USENET" NEWSGROUPS. If you can't be fun and sociable, please stay away.

If you post a "breaking event" message to ScanAlert, monitor the chatroom to hookup with others who might also be monitoring the same event (put a "meet in the chatroom" notice in your post to ScanAlert). If you post a message to ScanAtlanta/Alert for people to join you in the chatroom, remember, it can sometimes take 15 minutes for your emails to get out to people via EGroups.

That is a brief overview. Read the FAQ's on the mIRC website if you have problems connecting. Visit the homepage for ScanAtlanta at http://www.scanatlanta.com

2945. Re: radioamateur equipment in HONK KONG

Matthew,

I was in Hong Kong several time last year and visited several shops in the Nathan Road area. You definitely need to know exactly what you are looking for as well as the best price that you can get in the US. I was actually looking for an alinco DJX10T and in one shop although the guy did not have it, he wanted to negotiate the price first before he got one from his warehouse (or wherever). His attitude and approach made me nervous, so I reluctantly (because I wanted that radio) walked away. If you are traveling through Singapore, I've heard better stories about the shopping experience there.

I was in HK just before the British left and found the merchants up and down Nathan Road to be so RUDE! If they sense that you are not going to buy, they really treat you very badly. If you ask for a price and come back later, they yell at you! I couldn't believe it...

Also you can flip up switch 16 up for a 2 second delay on any band. You might try programming a little below and above that freq also to see if the scanner is on freq or some others in the 155 mHz range..

These links show a 'circle' where the ISS is in view.
http://spaceflight.nasa.gov/realdata/tracking/index.html
http://liftoff.msfc.nasa.gov/temp/StationLoc.html

However, I've noticed the 'spaceflight.nasa.gov' link differs several degrees
from both the others. I had to offset my system clock to obtain an agreement
between these sites. I queried the collective regarding this and people had
various comments. Suggestions: 1) my system clock is off (I verified it 's
correct)
2) the Kep elements for the 'spaceflight.nasa.gov' are not updated. #2 is my
UNEDUCATED guess.

I found most people were running S/W on their PC to track the sat's.
I downloaded SatScape last night for this purpose. http://www.satscape.co.uk/
It appears to be simple, even for this newby.

I was able to predict overflys quite easily. The output of these predictions
provide an elevation which is another way to judge 'receivability'.

I'll be back at my scanner at 10:28ET when the next overflight occurs ;-)
This elevation is gonna be 37DEG. The best all day.

Good Luck

In addition to the beacon, there was also some SSB (USB) activity around 145.9. just a few minutes ago (0015 UTC) Stupid me, I did not write down the callsign I heard - w0 something - and he was talking about being on a satellite.

I'm new to this satellite stuff, so I'm confused as to what I heard. Either this was AO-40 or (maybe) AO-10.

Anyone - clue me in!

thanks

don

AO-40 isn't going to be operational for quite some time. It is going to take about 9 months just to get it into orbit.

If you hear anything, it will be a beacon.

Well, the SSB activity certainly could have been AO-10. 145.9 is near
the middle of the downlink passband, where the ops tend to hang out.

Yes the VCO could be out of tune, maybe it only locks on the high end of the VHF band.
You need to fine the vco control voltage and see what it is at different frequencies. It should be
high, 20 to 25 volts at 162 MHz or so, and low, maybe 5 volts at the lower end, say 145 MHz.

You can tell if it is locked by moving your finger near the vco coil. If the loop is
locked, the voltage will go up and down as you detune the coil with your finger.

You can adjust the coil so the loop locks by watching the control voltage. It will jump to
some value and then move around as the coil is tuned. try it at the low end of the band.

Hope this helps

Tom

Hi- I have a pro 2006 scanner. It is modified for
cell and has the speed
mod. Has original antenna,box and manual. Scanner
is extremely clean and
pristine. The display light is not quite as bright
as it was new. Works great-just not as bright.
However it does have a on-off switch so you don't
need it most of the
time. Price is $250 including shipping payable by
money order/check (clear). Please email
bpk8227@excite.com is interested.

Minor clarification:
It doesn't need to be overhead.... but MUST in line-of-site.

> I've got a Radio Shack mobile scanner antenna outside, about 8 feet off the
> ground, so from what you said, I should be able to get it using my Trunktracker
> scanner...

Heard it again at 11:04AM ET. This is the -last- pass today ;-(

Queries in this newsgroups as well as rec.radio.amateur.space led me
to download a program called SatScape. This program predicts future
passes as well as other stuff. Highly recommended. (by this newby)

I just got to ask. Does the term rubber duckies refer to the stock
telescoping antenna. My RS2006 came with a ~30" telescoping
antenna.... and I'm debating if my new RS 20-043 discone is better
or worse than the stock telescoping antenna

2970. Introduction to Speech Inversion Descrambling!

Newsgroup: rec.radio.scanner
Date: 2000-11-19 00:00:00 UTC
From: ctpds49@aol.com
Message-ID: <20001119125720.20439.00000556@ng-bj1.aol.com>
Source record: 75551

Speech Inversion is accomplished by mixing the speech spectrum
(typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some
audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz
constituting the speech inversion.

Source record: 75552

Cheek was busted for operating a CB radio with WAAAYYY too much power. Part of the agreement was that he never transmit anything ever again. This isn't conjecture, he did it alright. Guys like Cheek have this Napoleonic attitude and just have to be in the gray area of the law all the time. What they do, or sell, isn't illegal in the letter of the law, but it is certainly in the spirit. Sadly, I suspect that Cheek had a lot of stress as a result of walking this gray line for so many years and I'm certain it aided in his pre-mature death. He also crossed swords with so many people we've long lost count. The time and effort that he put into his rebuttals and missives was proof positive that it was a consuming passion of his to belittle others. You just can't have all that bitterness inside and not have it affect your health (mental & physical) in a detrimental way. The fact that his illness started as lung cancer tends to imply that tobacco had a part in this as well. I think it truly a shame when someone as young as Cheek dies. It is generally accepted that we as humans are built to last between 100 and 150 years. It is entirely due to mismanagement of our health that we die younger.

A rubber duckie is a rubberized helical antenna that usually comes with a
portable radio.

If you run your PRO-2006 with an outdoor antenna, it will probably work
better if you put the attenuator switch in the "on" position. Mine did.

I found a Regency Digital Air Scan at a local swapmeet.
Table top model,probablly 1980s vintage.Anone have any experience with this scanner? Can tune in local tower freq., in VFO mode,but not sure about how to store frequencies into the memories,(10?).

Any sites with info on older scanners?

Thanks for reading this,and for any help.

Hello guys. I am new to this group so I hope I am within your guidlines for content.

Is their any place to download a PDF or similar version of the manual for the RS Pro-50 scanner?

Also I would like to build a simple outside whip type antenna for my Bearcat base scanner. I am in a low spot and want to raise the antena up on the roof peak. Is this feasable?

Thanks in advance for your help.

Andy :)

I'm still maintaining that the PC Works (by Cambridge Soundworks/Soundblaster/Creative) runs very big circles around any toy speaker from Radio Shack. It sounds like an old Blaupunkt console. Very mellow and warm. $50 or less, wherever PC speakers are sold.

Sorry about that rant :o) I just hate going to look for information (in this case, the serial protocol for the BC245 so I can write my own software), and having to turn off all my security filters because the site works /only/ if you allow Flash and/or JavaScript. I hate "form over function" web design.

Anyway, Pozilla WinScan really does have potential, but I can't seem to find a way to program trunking scan-lists. And it seems to have bugs in the way it stores it's data, which makes things difficult for me because I am trying to use Excel to create program lists. (There's no way to move/insert entries in WinScan. If you want to put a new entry in the middle of a sequence, you have to re-type everything after it.)

Go to www.radioshack.com , enter pro-50 in the search box. You will then have a menu of 11 documents on your screen. One is a detailed parts list, and the others are chapters from the manual. If you download all of them, you will have the full manual, plus a little extra.

You will not hear it unless it IS passing overhead. That band uses
line of sight propagation. I'm in N.Y. I have overhead passes that
start today (11/19) at:

7:48am
9:24am
11:01am

> want to buy one if 30 miles is too far.

If you get the original PRO-92, which tracks trunking using the subaudible data on the voice channels, you can track more distant systems at least part of the time, even when the control channel signal is too weak for reliable tracking. (Don't let everyone else tell you how "bad" the original PRO-92 is - I have two of them and they work just fine. There is a lot of misinformation circulating on the Internet about "wobble" and other supposed bugs in the radio that are not what people like to say they are.)

I have found that my various handheld scanners actually work better, especially in high RF environments, with the supplied rubber duckies than with bigger metal whips. The whips bring in too much signal and overload the receiver front ends, making the radios less sensitive than normal.

> Third, what is that Morse code sounding like stuff sometimes on police
> channels such as 155.640

Channel identification. The Morse code states the FCC-assigned callsign.

Hi- I have a pro 2006 scanner. It is modified for
cell and has the speed
mod. Has original antenna,box and manual. Scanner
is extremely clean and
pristine. The display light is not quite as bright
as it was new. Probably a 6 out of 10
However it does have a on-off switch so you don't
need it most of the
time. Price is $250 including shipping payable my
money order/checks (clear). Please email
bpk8227@excite.com is interested.
Bruce from Omaha

RJ,

Try using a Hustler mag mount scanner antenna (meant for mobile use)
which works wonderfully well sitting on a filing cabinet or even on a
hot water radiator.

I just check the Percon database, again, and it lists South Belmar as 460.475MHz. I don't live in the area but frequent it often so I won't be able to check which freq is right, but I'm assuming the 460 one is because it's also listed in the FCC directory and was updated this October. However, the darn PL/DPL will be harder to figure out. :-) Thanks again.

> for the Icom R75 is less than perfect. My question is this...
>
> What do you use besides the internal speaker.

I can't offer an opinion about the ICOM speakers. But here is what I wrote on a page at my Web site:

"From Radio Shack, in the 2001 catalog, our favorite speaker is now known as the RCA PRO-X44AV (black #40-5001, white #40-5002). It sells for US$60 but often goes on sale at a considerable savings. The speaker was formally known as the Radio Shack Optimus PRO X44AV (black #40-2080, white #40-2081) and prior to that the Radio Shack PRO 7AV (white #40-2048, black #40-2059). We use this speaker on all receivers on the tabletop."

I have six of these purchased over the years, so when I make a judgement on receiver audio it is on an equal footing. Hope this helps.

Hi Bill,

I use the Alpha Delta VRC- active filters and an excellent speaker.
First got this to help separate VLF becaons using the peaking filters-
excellent. I see them used occasionally for $150 or so. About $250 new I
believe.

Depending on the circumstances I do one of the
following:

Use head phones
Connect to a stereo

If I'm chasing noisy DX I use the head phones. Most
receivers have a head phone jack. You might have to
get a stereo to monaural adapter to get sound in both
sides.

If a have a nice clean broadcast on I use the AUX
input on the stereo for great sound.

>using the stock antenna. However, I did NOT know the relative
>location/distance at that time.

Again, thanks for the info! I double checked and there are actually more passes
of the ISS, throughout the whole day, so I may hear it yet... that's good to
know that I should be able to hear it even when it's not passing overhead...
I've got a Radio Shack mobile scanner antenna outside, about 8 feet off the
ground, so from what you said, I should be able to get it using my Trunktracker
scanner...

That was certainly true for WinScan v1, and that's what I did with the
demo. But I only used it until the demo timed out. Unfortunately,
such is not presently the case for WinScan v2.10, whose files use the
extension .ws2. It /would/ be true if there weren't a bug that
creates duplicate entries for some channels. That bug makes a lot of
manual cleanup neccessary.

It's also confusing as hell that although the program displays "empty"
channels as 0.0000 MHz, it stores them in the file as an empty field.
And if you dont' realize that and use 0.0000, the software ignores
those records and screws up your organization by banks.

Also, it did not read the talkgroup/scan list info I had programmed
into my scanner.

Thomas Jefferson called our system of government a "representative
democracy". You are wrong about this being some modern and incorrect
use of the term.

... Erich

I saw a Missouri State Highway Patrol car the other day..... it was a 2000 dark blue Ford Crown Victoria....
Had the regular antennas but I noticed a 6" whip that looks just like a portable scanner antenna.... it was sticking out of the rear "dash" (inside the car) where it could be seen from the back window... does any one know what this is for? Just thought it was odd and had never seen in IL.

Thanks
Terry

If you actually look at the WinScan frequency files (*.wff) you will realize they are just flat, ASCII text files, with each field being a string, enclosed in quotes, and delaminated by a comma. These files can easily be edited with any text editor and likely be imported into spread sheet programs. If not, it's pretty easy to write simple programs, even using a simple scripting language, to update & manipulate them. Anyone contemplating writing their own software to do what you have described should find reading & writing these frequency files a snap.

3052. Re: Pro 92 Scanner

Newsgroup: rec.radio.scanner

It all depends on what you need the radio to do for you. If you need to listen to a large (20+ channels), busy trunk system, you'll likely be disappointed. I have a 92A and a pair of 2067's and they all fail to detect the trunk id about 30 percent of the time. That's on the Suffolk County, NY system. On the other hand, I use these radios in New Jersey and they work flawlessly on the NJSP system (12 channels). They also work quite well for conventional use. They have decent sensitivity (a bit deaf on 800mhz), excellent audio, and are among the best scanners I've used when it comes to overload from paging, etc. The 92/2067's are also unique in that they do nearly instantaneous dectection and display of CTCSS and DCS tones. There are a few other radios that will do tone search, but they're slow and not always accurate. The 92/2067's will show you the tone in the blink of an eye and it seems to be right every time. The only other rig I have that will do this is an Opto Electronics Optocom with Probe software. I also love the alphatags, particularly in NJ where I don't have all the frequencies in my head. The GRE Datamanager software is handy, too. It's one of the better freq loader programs I've used and I find it really useful to be able to load my 92A for use at home or in NJ. The bottom line, in my opinion, is that these radios are darned good scanners unless you need to monitor a large, busy trunk system. I would not pay the full price, though. When they're on sale, they're a good deal. Take care.

Maybe you're really looking for a PRO-67:

PRO-67: 1997 vintage. Good portable 200 channel scanner
using up conversion. Replaces PRO-51 and has better image
rejection and super fast scanning. Service Search lacks
police frequencies. Fixed AM/NFM modes and step sizes. Can
lock out up to 20 frequencies during a search. Can recharge
AA cells within the scanner. Frequencies adjacent to the
cellular phone bands censored so our PRO-67 will not receive
868.9625 or 823.9625 MHz. Intermediate Frequencies are
254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67,"
by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for
a review which includes quantitative test results.

An Optocom with Probe software is a really nifty combination. On a less intensive PC/Scanner level the use of PC's to upload frequencies to a scanner is a nice feature as well. I do so with my AR-8000, Ar-8200 and my PRO-92. Makes changing scanner setup for different locales a snap!

They are acknowledging directions to retune their radio to 133.450 MHz or 132.450 MHz for further communications with KC Center or some local approach or departure control.

Hopefully by now everybody has the frequency
of Phila PFF Radio - if you don't, it's 452.725
PL 203.5. We are the Delaware Valley's only NEWS
& Fire Notification Network and we are sponsored
by a few Major News Networks. Any time of the
day,if something major/newsworthy happens in the
Delaware Valley, chances are great you will hear
it on PFF Radio!
We now have 35 dispatchers scattered
throughout the Phila., SEPA and SNJ area. If you
have any interest in public safety radio, & would
like to jump in on the fun, just email me at PF-
71@webtv.net .
We are a FREE service - all you need is a
UHF 2-way radio. Give us a listen, alot of our
members are responding to the scenes of incidents
(we usually have multiple people covering an
incident from all angles).

Message-ID: <211120000916050933%bharper@vt.edu>
Source record: 75524

While driving to work Tuesday morning, I listened to the Va. State Police dispatcher in Wytheville issue a BOL. A purple van had left the McDonalds in Princeton, West Virginia, headed south on I-77. The driver had left his wife in the restaurant. A short while later, the trooper reported to the dispatcher he had seen and stopped the vehicle. "I gave him the information," the trooper reported to the dispatcher, "but I think he's scared to go back there now."

Too bad for the driver if he and his wife were headed to his in-laws for Thanksgiving . . .

Bruce in Blacksburg

3078. PRO-2004 question

Newsgroup: rec.radio.scanner
Date: 2000-11-21 00:00:00 UTC
From: Bill Webster <billw1@ispchannel.com>
Message-ID: <3A1A95F6.3A44F3E2@ispchannel.com>
Source record: 75527

I recently bought a used PRO-2004 scanner. I don't know if it has a problem or if I am doing something wrong. On all frequencies, the sound drops out every 2 seconds very briefly. It happens continuously and the timing is exactly 2 seconds. This happens even if there is no signal (squelch all the way down so that you hear white noise). How can I solve this problem?

Thanks!

Bill

I've been considering the purchase of a BC 245XLT. I downloaded the documentation from Uniden, and it says that it tracks 800/900 MHz trunked systems. My local police use what I thought was a trunked system in the 500 MHz range. Can this scanner handle that?

3090. For Sale: Optoelectronics R11 Test Receiver

For Sale: Uniden BC245XLT TrunkTracker II
Age: About 1.5 years (original model w/5 second delay, obviously)
Condition: Very good, battery cover has band coverage printed on it; print is a bit smudged. LCD is in good condition.
Use: Primarily indoors, on rare occasion mobile.
Includes: 3 BP-180 NiCad battery packs (that's one extra), external battery pack charger (power cable was sliced to work on my 12VDC system, will re-splice with 12VDC wall wort), original antenna, manuals, original box, serial cable.
Paid: $220 new (Lentini Communications)
Asking: $150 plus shipping, either UPS COD or Pre Pay. Payment either way to be made by US Postal Service Money Order only!!
Reason for Sale: Well, I have seven (yes, seven) setups that follow trunked communications. The 245 has seen little use as of late.
If inquiring, please reply to halligan@mediaone.net

Thanks for reading, and Happy Thanksgiving.

Scott -

While there has been much discussion of individuals having problems with the Icom software, what Chris is reporting, as far as I remember back to when the 1000 first came out, is, in fact, 'new' information -- namely, that the software is resetting the baud rate of the radio at regular intervals with a G105 command.

What is even more interesting is that, using the same software to monitor the transactions between the Icom software and the 1000, I do not see a G105 command being sent in my environment except at power-on, which is why I am among those who have never had a problem with the Icom software, and may explain why Icom has never 'fixed' what they too might never have seen in their own environment.

Might be a current report of their flight level to the ATC control.
They fly at about that altitude.
3245 could mean 32,450' feet.
Seems to make sense but I don't know for sure.

There are some enroute HF frequencies in the 2850 to 3155 kHz range
but these are used when the aircraft is over water.

Here in my area we have an ATC controller that talks about as fast
as the guy in the FEDEX commercial ! Must become so routine they
could do it in their sleep.

On the scanner/pc thing , I use my PC to program the radio.
Its a lot easier and now ICOM even has a place where you can download
frequencies for your local area @:

http://www.icomreceivers.com/

>
> ... Erich

"representative democracy" is a poor way of saying "republic" (and quite
obviously an oxymoron). It is used by those who refuse to accept the fact
that the US is not, never was, and never will be a democracy, whether
pure, social, or imagined. As defined a democracy is direct rule by the
people by way of majority. Some call it "mobocracy".
On the otherhand a republic is indirect rule by the people through a
representative government consisting of a Legislative and Executive
branch. Republics cannot have a monarch as a ruler, but does have an
elected offical with the title president.
Take, as an example, the current presidential election. One candidate
will have the popular vote, another the electoral. The candidate with the
most electoral votes, as we know, becomes president. This would NOT
happen in a democracy, as the people have direct influence, by majority,
on the outcome of an election.
The republican style of rule under which the US was founded is there to
attempt to take out the factors of bribery and emotion in the election
process which would most likely be considered factors in a democratic
style of rule
(Of course, we know this does not always work!).
Current dictionaries list "representative democracy" and even "democracy"
as "rule by the people indirectly". This is incorrect and only recently
has this become the norm.

You're right. Dictionaries do disagree with your definition. Our
democracy seems to be defined under number 1...

deï¿½mocï¿½raï¿½cy (dï¿½-mï¿½kï¿½rï¿½-sï¿½) n. pl. deï¿½mocï¿½raï¿½cies 1. Government by
the people, exercised either directly or through elected
representatives. 2. A political or social unit that has such a
government. 3. The common people, considered as the primary source of
political power. 4. Majority rule. 5. The principles of social
equality and respect for the individual within a community. [French
dï¿½mocratie from Late Latin dï¿½mocratia from Greek dï¿½mokratiadï¿½mos
people; See d ï¿½- in Indo-European Roots. -kratia -cracy]
d ï¿½-. Important derivatives are: democracy epidemic demon tide 1 time
To divide. Contracted from *da ï¿½-. I. Suffixed form *d ï¿½-mo-, perhaps
ï¿½ division of society. ï¿½ DEME , DEMOS , DEMOTIC ; DEMAGOGUE , DEMIURGE
, DEMOCRACY , DEMOGRAPHY , ENDEMIC , EPIDEMIC , PANDEMIC , from Greek
d ï¿½mos, people, land. II. Variants *dai- , *d ï¿½-, from extended root
*da ï¿½i-. 1. Root form *dai- . GEODESY , from Greek daiesthai , to
divide. 2. Suffixed form *dai-mon- , divider, provider. DEMON , from
Greek daim ï¿½n, divinity. 3. Suffixed variant form *d ï¿½-ti-. a. TIDE 1
; EVENTIDE , from Old English t ï¿½d, time, season; b. TIDE 2 , from
Old English denominative t ï¿½dan, to happen (< ï¿½ to occur in time ï¿½);
c. TIDING , from Old Norse t ï¿½dhr, occurring; d. ZEITGEIST , from Old
High German z ï¿½t, time. a, b, c, and d all from Germanic *t ï¿½diz,
division of time. 4. Suffixed variant form *d ï¿½-mon-. TIME , from Old
English t ï¿½ma, time, period, from Germanic *t ï¿½mï¿½n-.[Pokorny d ï¿½-
175.]

Check out www.amsat.org.

ISS ham radio is on 145.800

ISS to ground control is on 143.625

Chris, I also have the PCR-1000 and experienced the same problems, I was told by ICOM, that is was a compatibility issue with windows 98 and 95, can you believe it? ICOM said that it would work excellent in 95, but for some reason communications between the PCR-1000 and windows 98 are incompatible.

So my next question to ICOM was "Do you have a patch or a new version?"

"NO", was his answer. Can you believe it?

Anyhow if you manage to fix it, let me know.

Just to make sure that it is working properly, you should also be hearing a beep (low/no battery alert) every two seconds when the sound drops. It would be the same type of beep that you hear when you program the radio.

Depending on what you want to hear, you might want to try
a very basic VHF (130-180 MHz) handheld scanner, the TigerScan.
This would receive weather, and 2 programmable VHF emergency traffic
channels.
specs at www.electracorp.com

Notice our holiday special,
now $10.00 off the regular price :)

A great Stocking Stuffer;

with thanks to the scanning community.

It's unlikely that they are reporting their altitude with that much precision. The most precision that I've ever heard is to the nearest 100' of altitude, e.g. - Flight Level 324. However, this would have to be an altitude that the plane is passing through, since Flight Level 320 is an unusable altitude (at least in Can. and US. airspace). They are probably just abbreviating their frequency change readback to the controller.

Are they passing altimeter settings? Planes have to adjust their altimeter setting all the time everywhere they go. They get the setting from the air traffic controller. This is basically the altitude of the airfield above sea level. When they are landing, in an attempt to land at an airfield that should be at 0 feet (sea level), they offset their altimeter reading by the altitude of the airfield to make it appear they are landing at 0 feet. Usually they update it when taking off or landing, but could possibly be updating it enroute. Also, changes in air pressure can affect the reading the pilot gets in his aircraft (pressure altimeter) which causes the air traffic controller to pass different readings at different times, but this doesn't normally swing 100 feet.

Just an option....I tend to lean towards the frequency thing though.

Hi, from Bob - the guy who started all this.

I have been paying very close attention the last couple of days to the transmissions, and I have looked up freqs. in the ZKC zone and done some experimenting and learned that the pilots are indeed just acknowledging a frequency change. They use short hand, for instance 133.45 might be called 3345 or 345. They don't all use the same shorthand. It appears that the standard protocol when entering the Kansas City ATC area is to acknowledge the new frequency with "Good morning" or "Good afternoon" so you know they are signing in to the new ATC. When they leave they end their transmission with G'day or Goodnight - so you know they are moving on to a new ATC. It took me a couple of days to get on to it because they must teach speed speaking at pilots school. Occassionally (rarely) you will hear someone speak slowly and ennunciate the whole thing "One Three Three Decimal Four Five". Interestingly, to me at least, is that these pilots spend an enormous amount of time searching for a "clear ride". The vast majority of xmissions are requests for a new altitude due to "light to moderate chop" (translation: the passengers are all blowing chunks.

Thanks to every one who helped. I'm really new to this but I enjoy it greatly. I am semi-invalided and work at home in front of my computer all day with only house cats to talk to. It has put me back in touch with the world.

Bob

It is still modern and incorrect in the way it is used. It is still an oxymoron.
Though I will stand corrected that it was never ever used before modern
times (is that what I said, really?). In notes written by Jefferson
before and after the one you quote, which is one of very few times I can
find that he used the term, especially compared to the pure terms
"republic" and "republican", he has
stated his distain for the way the governmental structure was shaping up.
This was the first time a "pure republic" as he called it was being
developed and there were flaws in the system. He also received letters
from foreign dignitaries (sp.) asking him how he could use the term
"republic" when refering to the US and was puzzled as to what he should
call it. Was this why he began using the bastardized term "representative
democracy"? Don't know.
You will also find times afterwards where his frustration was growing,
especially with the exhisting branches of the government, and specifically
with the senate and military where he felt their system of "election", or
more correctly "appointment" went against the republican thinking.
I guess we can sit here and site individual cases where one term or
another was used, but I assure you "representative democracy" will not
come out ahead. It is still an incorrect term and should die a horrible

death. Our founding fathers had no intention of the US being a democracy in any sence of the word. The US will always be a FEDERAL REPUBLIC and I will always be a STUBBORN BASTARD. Thanks for the discussion, it made me pull out the ole' books on T.J.!

Hello

I would like to know if there is someone that know wich is the best type of antenna
for monitoring ACARS. I am curently using a 100cm car antenna, and this is the best solution so far..
i have allso tryied allband antenna and so on. I cant use outdoor antenna because i live i the middle of a city so i would need
an indoor antenna of some kind...

thanx for answers

Sebastian

I have recently purchased a Midland 70-1548 VHF Radio

Is anyone out there familiar with this radio?

I am having a problem having it scan more than 7 channels out of the 16 channels. Is there something you have to do in order to include the channels you want to scan?

Thanks for any info

I have heard that some services use Lindenblad antennas at airports
to pick up planes at various elevation angles. Evidently, the
Lindenblad has a nearly perfect pattern for such an application.

Unfortunately, the Lindenblad is a confusing shape and may be
difficult for some to build at home.

While the pattern is not the same, the "egg beater" type antenna
is easier to duplicate and does receive at various elevation angles.

These antennas are sometimes described in amateur satellite manuals.

Hope that helps.

Brian

3138. No More BC245xlt Delay!

Newsgroup: rec.radio.scanner
Date: 2000-11-22 06:22:00 UTC
From: Keith <kewyatt@apexmail.com>
Message-ID: <c2pm1t0cb9bh8q2u0vcp2aitvg3036iivo@news>
Source record: 75419

I have been reading the back and forth about the "five second delay" on the BC245xlt and I found out something very interesting. If I have the control channel in the programming mode with the "delay" on then I will experience a 5 second delay, if the delay is not on the control channel and no other channels that are part of the trunk channeled system there is no delay. I have the first version of the 245 and keep in mind that I only monitor one trunked system along with other banks of conventional frequencies, but this could be something to check out if you have the first version. What Uniden probably did with the update was simply make the radio ignore trunked and control channel delay settings that are programmed into the radio.

Source record: 75420

my two bits:

cop A's radio is transmitting on 460.15 and the towers and dispatcher on
460.10

the first call you here is from his radio, when he calls back to the
dispatcher, you hear it on 460.10 from the tower. This would make sense
especially if you have a delay set on 460.10, which would hold you on this
frequency so that you would not scan back to cop A's original frequency.

The 245 does track systems in the 406 - 512mhz range. Use E2 UHF as the trunk mode. You will need to know the base frequency & offset for the system you want to track. But ensure it is a Motorola type 2 system first. To be sure, just ask your dealer for a trial before you buy.

Good Luck
Mike

try turning off the windows polling of the serial port. Windows constantly is looking for Plug and Play devices attached to the comm port and the PCR-1000 is not one. It just might do the trick. Go into device manager and turn off automatic settings for the comm port in use.

I've been considering the scan rate update (increase!, not decrease!)
for my RS2006. Does the increased scan rate come with any drawback?
Does the decreased time spend interrogating each channel decrease
the ability to pick up weak signals?

> Just being a wise-ass,
good one ;-)

What would be a reasonable price to pay for a second hand but like new condition Scout? New price is $349-00.

3151. Happy Thanksgiving!!!

Just wanted to say have a happy and healthy Thanksgiving. I don't suppose there will be as much action on the scanners as Fourth of July night. Happy Holidays.

Thanksgiving Proclamation of 1863

It is the duty of nations as well as of men to own their dependence upon the overruling power of God, to confess their sins and transgressions in humble sorrow, yet with assured hope that genuine repentance will lead to mercy and pardon, and to recognize the sublime truth, announced in the Holy Scriptures and proven by all history, that those nations are blessed whose God is the Lord.

We know that by His divine law, nations like individuals, are subjected to punishments and chastisements in this world. May we not justly fear that the awful calamity of civil war, which now desolates the land, may be a punishment inflicted upon us for presumptuous sins to this needful end: our national reformation as a whole people?

We have been the recipients of the choicest bounties of heaven; we have been preserved these many years in peace and prosperity; we have grown in numbers, wealth and power as no other nation has ever grown. But we have forgotten God. We have forgotten the gracious hand which preserved us in peace and multiplied and enriched and strengthened us, and we have vainly imagined, in the deceitfulness of our hearts, that all these blessings were produced by some superior wisdom and virtue of our own. Intoxicated with unbroken success, we have become too self-sufficient to feel the necessity of redeeming and preserving grace, too proud to pray to the God who made us.

It has seemed to me fit and proper that God should be solemnly, reverently, and gratefully acknowledged, as with one heart and one voice, by the whole American people. I do therefore invite my fellow citizens in every part of the United States, and also those who are at sea and those who are sojourning in foreign lands, to set apart and observe the last Thursday of November as a day of Thanksgiving and praise to our beneficent Father who dwelleth in the heavens.

Abraham Lincoln
